When adjusting the 2M RF Gain via the menu there seems to be no change in gain from about 15 to max. Has anyone else experimented with this adjustment? I have other signs of a bad RX stage on 2M.

I did this also to "pickup" the receive on mine for 2M. Then I called
Yeasu and they said "don't mess with it!" I hope your recorded the
original settings, because this setting is different with each radio.

I plan to take the "wait and see" approach. Wait and see if
anything else don't work before I return it for repairs.

Okay.......

I've been monitoring the group for a while, and I am really impressed with the quality of help and insight you all have into what I believe is the exact radio I need...but now, I need your expertise.

I recently purchased an FT-100 and ATAS-100 antenna, intending to use it as I upgrade my license, but, right now, using it on 2M sideband. However, just to make sure that the money I invested was being put to good use, I turned the radio setup over to a friend of mine, Advanced class, to "Put the system through it's paces." After reading the instructions, then throwing the manual away and reading this group for the truth, we supposedly connected everything properly, and the damn thing will not work. We grounded the mount, tried all the menu settings, triple-checked everything, and all we get on the screen is "ANTENNA ERROR". We are using it on a properly grounded vehicle mount, power for the radio is direct wired to the battery, all connections checked, and, NADA. Is there anything I can check before boxing up the whole shooting match and asking Yaesu to face east before inserting the antenna in the proper receptacle?

YOU guys are the real experts...HELP!!!

That usually means you have a coax / mount problem. Check your coax for a pinch or cut.
Check you coax from center to shield too for a short.
You did not mention if you have a duplexer for vhf/uhf and HF on the same atas-100.
If so try the atas-100 on the hf side only pigtail. Make sure you are on atas-1 setting of
menu61 if you run a duplxer or atas-2 if you have a separate antenna for vhf. Let me know how you
make out. This infor is from my past experience.

Hello,
this is the second time I have sent mine in for warranty service. The first time took 12 days from the time I dropped it off at UPS until the time they got it back to my door.
The second time I sent it off on 8/21 and got it back on 8/30 That is very good service I think.
They fixed all the things that were wrong with it both times but it seems they just can not get it right on frequency on 2 meters or on or hf. I think that is why the new D version includes the High-Stability Reference Oscillator (+/- 1 ppm) would be my guess.
My 706 was always right on frequency when I went to 2 meter ssb or hf but this is always off. Not real bad on HF but pretty bad on 2 meters ssb. Oh well, my warranty is just about out and I am afraid I will just be stuck with it. but I can adjust for it.
I might send it back in once more before it runs out but at $22.00 to ship it to them and then they cant align it up I don't know if I want to bother. But other then that it is a nice radio and I enjoy it.

Best Regards, Dan KM6CQ

Somebody with a schematic could figure out if there are two frequency references in the radio. I would guess that only one reference is used, so it wouldn't make sense that difference bands would have different tolerances.

Hi All,

As for the "good Stuff" listed about the FT-100, I totally agree! I'm sold on the radio! I run mine mobile in a Ford ranger XLT, '99 with Hustler monobanders and a separated control head mounted on the hump. I really like the noise blanker and the DSP functions and I've really just begun to learn all the "bells and whistles" it has. I've worked some nice DX since I bought the rig last January. This is a great all-around radio for the money! Add my name to the "Happy User List"

Tom, N4GVK

Yeah I think your right.
It is close on hf when I check it against WWV but 2 meters ssb is really
off. But of course it is not a problem in FM. My 757GX2 890AT and the 767GX
have always been perfect as well as my 706 I had. Yes I have had a few rigs
over the years.

Not to be a PITA (though it comes naturally), but sideband is kind of funny since the modulated signal has a mean frequency that is different from the carrier (that is of course if you had a carrier ;0)) I guess my point is how do you know the sideband freq is off. Can you hit the PTT but not modulate, and try to measure the frequency of the carrier leak? [Sideband isn't perfect, so some carrier will leak through, though on a good radio it should be small.] Do you have a frequency counter? [If you look around electronics flea markets or Ebay, you can get yourself a frequency counter that will last your entire ham "career" for around $200 to $300 (if you want gigahertz performance) or under $200 for UHF coverage). A friend with a service monitor or spectrum analyzer would be even better.

If you look at FCC listings for sideband transmitter, the data tries to reflect the difference between the carrier and the modulated signal. I don't know if they measure the modulated frequency or use an equation.

I have several people here, that are on 2 meter SSB. All of us vary in Freq by as much as 1.5 Kc. Now 4 of us have freq counters, guess what only 2 agree exactly the other 2 are off 500 Hz and 900Hz. It don't sound like a lot but it makes a big difference. Determining your exact Freq. will vary with how you measure your freq. We all tune to each other(who ever was there first is where we all tune to.

Does your 100 have the tcxo? if it don't it may be off 4ppm or +-4 Hz for every mHz. That equates to +-576 Hz at 144 mHz or +-1728 Hz at 432 mHz. So determine how far off you think you are and look at the above figures, if it varies more than the above, then you may have a valid point. I have a 100D with the TCXO which is +-1ppm ,therefore it should only be off +-144 Hz at 144 mHz or +-432 Hz at 432 mHz. Also check your reference (counter, or other receiver) and see what the stability is listed as. If your counter has +-10ppm well at +-1440 Hz at 144 mHz it will not be a whole lot of help and even worse at +-4320 at 432 mHz.

as long as you can tune to the other guys and you are in the band, that is all you need for 2 meters and up. That is unless your willing to pay for a Lab grade Freq Counter.

Now reading the above you can see that you don't want to operate close to the band edge, lest you fall out side.

Hello, wanted to pass along my personal comments about this combination. You read about all the problems people are having here. Alot of them are not taking all the precautions of ensuring everything is done the right way. I have the FT100 with ATAS100 mounted in a '98 Cavallier with the K400 Diamond trunk mount. I also have an 1" wide ground strap on the radio case going to the bolt of passenger's side side. Also another ground strap from the hinge of the trunk to frame of vehicle. Results: 100% tunable on all bands...i.e. 40-6mtrs. I use a diamond SG7900 for vhf/uhf. This unit was sent into Yasu for updates (grnd strap and cap) and would recommend this setup to anyone who wants a complete, functional, attractive appearence. I have owned the 706 orignial, MKII, TS50, all nice units but this setup beats others hands down. Problems you read here seem to happen when people do not think a seperate grnd is required, or when people get into menu settings and start to fiddle, not knowing what they are fiddling with. I ran the Diamond MV3A with the seperate loading coils on it, couldnt get any sort of bandwidth, coils very small in nature...went to ATAS100 bingo! Please take the time to install as heavy as possible ground lead from the case of radio to frame(not body of vehicle) and grnd @antenna portion as well. I welcome any comments/emails. One final sidenote: Yaesu's mod with shipping there and back was 1.5 weeks!! They even reimbursed me for the outgoing shipping cost! Professionally minded people! Thanks for reading and welcome comments/emails....73 and good luck...Mike WD8BMP

Hey folks, it seems such a waste of bandwidth to see pretty well each post also having the entire history text below it. Why not just post your message without it?
Also, have had a FT100 for about 6 weeks now and love it. No problems as of yet and I am optimistic that I won't have any. Sure wish it TX below 140 though....

The original message looked like it was sent via CW. So, let's just assume for now that the message was transcribed using some sort of CW-to-text device and not make judgements the sender's unawareness of the caps lock key. Maybe it was sent while the person was rolling down the highway in an 18-wheeler at 65 mph, and, if so, it was remarkably legible.

hi yall. i've been looking at this group for about a week now and have learned much. thank you.

i just bought a ft-100 with the atas antenna. i don't yet have a owners manual. i bought the unit used. would someone mind posting the menu number 61 settings and each of their meanings? so far i can't get the ant to self tune. i don't doubt the error lies with the operator.

this is my first hf rig. i just got my tech license in july. i want to listen for now to learn the band freqs and 30 meters to learn code.

has anyone yet scanned the owners manual?

thanks in advance,
joe

Hi James ...
if you use non-resonant antennas for reception a good tuner will help to reduce also
IMD . Remember this is a rig for portable and mobile use and you will experience the same problems with the IC706 or remember the TS50 which had a terrible frontend.

Hello Walter

I totally agree with you, I used the TS50, and the IC706 on my sailboat using the backstay as antenna.
The backstay is abt 10 meters long and a L filters used to adjust the impedance to 50 Ohms
During the evening when the broadcaststations are getting stronger the IMD on 14, 18,and 21 was very bad.
At every 5Khz a broadcaststation was present.
Now I am using the FT100 and not as bad as the others but same problem.
Using a good antenna tuner based on a highpass filter will cure the problem.

From: Jerald Hoskelis
Topic: 4745 Message: 4745

I will be going over to the island of Caye Caulker,(IOTA Na-073) Belize on 29 Sept and staying thru 1 Oct. I will be using the FT-100 and two half sq. antennas (one on 15 the other on 10). I will be operating around 21.260 most of the time, if 10 opens up I move up to 29.500.
I tried the Ft-100 last March on the WPX contest to see how the unit would hold up with 36 hours of hard use. The unit stayed cool even with the auto voice keyer running 8 sec on and 5 sec off. The end result was I was about 2000 contact below my normal score. My main contest station is a Yaesu FT-767. I had many requests for repeats and weak signals reports. I used the Hiel Pro headset with the DX mic. The unit had been set up and test along side the 767 before the contest.
The FT-100 makes a nice general purpose travel unit, but think that I will remain with the FT-767 for the contest station.
73's and hope to hear some of you.

4746. Re: [FT100] atas settings

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-04 13:16:56 UTC
From: Lee Devlin
Topic: 4746 Message: 4746

Hi Joe,

I copied the section from the FAQ that describes the menu 61 items. It was an area that was originally incorrect in the manual so I would expect that if you order a new one, you'll get one with the corrections. Contact Yaesu for the current part number and cost. For parts: yaesuparts@...

To summarize, there are 4 choices: OFF, Tuner (for the FC20 autotuner), ATAS-1 (one antenna), and ATAS-2 (when using a separate VHF/UHF antenna).

Lee Devlin, K0LEE
http://members.home.com/k0lee/ft100faq.html

ATAS-1/ATAS-2 Settings

Menu item 61 is has several settings for controlling the way the ATAS100 antenna works. In the user manual, there are several errors describing this function. On page 14, the instructions are correct and the easiest way to remember the correct settings are: ATAS-1 = one antenna ; ATAS-2 = two separate antennas. In other words, if you're using the ATAS100 on all bands (with a duplexer), choose ATAS-1. If you are using the ATAS100 for HF only and a separate antenna for VHF/UHF, use ATAS-2. Page 62 in the manual is backwards from this as is page 94 which recommends that a duplexer is required with ATAS-2. The newer manuals may have corrected these errors but as of manual revision E08981003 the mistakes were still present.

Another user noticed that when either of these selections are made, the radio will not transmit on the 80 or 160 meter bands so don't forget to switch menu item 61 to OFF (or to Tuner) when you switch from the ATAS100 to another antenna.

Denny,
I keep a small hand held tape recorder in the truck and record the qsos that I make in the car, then play them back when I am in the shack so I can add them to my log-eqf software that I have here as well.

I find writing way to difficult as I tune in a station, adjust the DSP, turn up or down the volume, mess with the RIT .. and oh yes... Drive! ;-)

The tape recorder has a 'vox' setting so all I do is have to remeber to turn it on, turn it off, and turn the tape over.

Denny,

Log? I don't keep no stinkin' log!

I've had a lot of great CW QSO's while mobile. But, none that cause me to want to preemptively send a QSL--meaning I would have to keep the QSO info somewhere/somehow. If I receive a QSL, I return my QSL with the received QSL's log info.

If you really, really, really want to log each and every QSO while mobile, try a little Radio Shack microcassette recorder. You can 'fill in the log' without taking your eyes off the road. A number of years ago, the Texas DX Society conducted the Great Texas Armadillo Run. We put on every county in the 5th call district (except Texas--we did Texas' 254 counties the year before) on the air in one weekend. I used a microcassette recorder I used in school take notes to record the logging. Worked great. I did 700 QSO's, single-op, CW, mobile, through 35 counties of Arkansas and Louisiana, and drove 1900 miles. Fun!

An alternate way, but still audio, would be if you have a PDA (personal data assistant--I have a Compaq Aero 1550 palmsize PC) which has audio record/playback capability. It's a snap to record something on it, then, later, transcribe it to a Pocket Excel "logbook".....if you want to....

Topic: 4747 Message: 4753

Hi,
Since I work a lot of Islands for IOTA and USI, I do need to log them stinkers...

I have used several methods to log mobile contacts. Quick notes on index cards, or on a small spiral bound notepad works for one or two contacts at a time, and can be entered into a program later. The tape recorder is also great, and is better when working a string of qso's while in motion.
I also carry a full sized PC, MidTower style, in the van, which has had a special 12V power supply installed. This is often used while stopped to log long runs using Logic, or Writelog, or CT. Recent favorite is Writelog. This is the best way, when the PC is not making any noises in the RX, and that is another issue.

Very recently, I acquired a Fujitsu Stylistic 1000 notepad at a hamfest. It is big enough to run Win95, and is loaded with Writelog. I use an attached keyboard instead of the handwriting recoginition pen, but plan to try the pen for casual operations. This arrangement may be the optimum, as it is small, very portable, and runs a good Windows based logger at a reasonable speed. It is also networked. With room for 2 pcmcia cards and a type III drive, it was easy to put in an ethernet card, and do a peer to peer share with the othe computers in the home shack, and the van. So I just bring the Fujitsu inside after a trip, and load and merge the log into a main log. It seems to be free of RFI in the RX, and has not reacted to high power levels run from the screwdriver, 600W HF.

I also have a Fujitsu 500, which is a monochrome, slower version of the above, and I am going to try to get it going the same way.

A little velcro on the dash, or panel makes for a convenient mount.
These little notepads run $150 to $300 depending on memory, hard drive etc.

You may want to check this out as a lower priced way to get a computer logger for mobile operations.

From: Paul R. Valko
Topic: 4717 Message: 4754

Don't let your buddy's "advanced" class license impress you. There are plenty of really dumb "extra" class hams out there. Myself, I'm just ignorant, but I learn new things daily and hope to improve.

First, the menu setting (menu item 61, if I recall) for the ATAS is "ATAS 1" for a single antenna set-up, and "ATAS 2" if you are using and ATAS on HF, and an other, separate antenna for VHF/UHF.

By the way, the up/down buttons on the microphone don't tune the rig, only the up/down buttons on the radio faceplate do that!

Then... replace the antennas with a 50 ohm dummy load of appropiate power capacity to rule out a bad antenna and/or coax. Oh... your "advanced" friend doesn't own a dummy load? He's still a novice!

Finally, take the appliance over to someone with a known good antenna and power supply. Try it there. We have several guys on our local repeater with FT-100's and we have met several times to swap out radios in different cars/antenna setups.

By then, you'll know if the FT-100 bit the dust or not.

I suspect that to help out Joseph, it's going to be important to get into the exact specifics of what he's set up. Like Paul, I'm a long way from an expert anything, but I did want to clear up the comments below that could lead to confusion.

The up down buttons on the rig allow you to manually tune (move up or down) the atas antenna, rather than the rig. As well, there is in the function menus, the "TUN" button, which will auto tune the antenna to the correct length for the frequency, provided that everything is fully operational, grounded correctly, etc. As Paul notes, the buttons on the microphone have nothing to do with tuning the antenna.

[stuff deleted]
By the way, the up/down buttons on the microphone don't tune the rig, only the up/down buttons on the radio faceplate do that!

4756. HELP!!(ATAS-100)

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-05 15:28:24 UTC
From: Bob Evans
Topic: 4717 Message: 4756

Joe,

The best way is to take the radio to a base station with antennas that are known to work. Try the FT-100 there to verify that it works. Find someone who owns an MFJ antenna analyzer (Model 259 or 269 are the model numbers, I think) and see what SWR the ATAS-100 reads with no rig attached. I'll bet both are working fine but you have a piece of bad coax or a non-soldered connection somewhere in the line between the rig and Antenna.

One quick check is to see if you can manually adjust the ATAS-100 by holding the mike button closed and punching the UP or DOWN buttons on the front panel (it doesn't matter which HF ham band you're on for this test). The antenna should go up and down accordingly after a 1-2 second delay. This assumes you have set the rig menu set to use the ATAS-100 on HF. If that doesn't work, you have bad coax/connection or you didn't set the menu correctly or the rig is broken.

Don't throw the manual away because it has a lot of good stuff...you just have to read it several times before it sinks in well enough to understand! At least it took me several reads to get it. I still don't get all the memory choices, but that part is really low priority for me.

Good luck,
Bob K5WA

>Subject: HELP!!(ATAS-100)

Okay.......

I've been monitoring the group for a while, and I am really impressed with the quality of help and insight you all have into what I believe is the exact radio I need...but now, I need your expertise.

I recently purchased an FT-100 and ATAS-100 antenna, intending to use it as I upgrade my license, but, right now, using it on 2M sideband. However, just to make sure that the money I invested was being put to good use, I turned the radio setup over to a friend of mine, Advanced class, to "Put the system through it's paces." After reading the instructions, then throwing the manual away and reading this group for the truth, we supposedly connected everything properly, and the damn thing will not work. We grounded the mount, tried all the menu settings, triple-checked everything, and all we get on the screen is "ANTENNA ERROR". We are using it on a properly grounded vehicle mount, power for the radio is direct wired to the battery, all connections checked, and,

NADA. Is there anything I can check before boxing up the whole shooting match and asking Yaesu to face east before inserting the antenna in the proper receptacle?

YOU guys are the real experts...HELP!!!

Hi Denny,

I don't keep a log when I'm mobile.

I can drive and send/receive at the same time, but not write!

YES I did not list the full procedure but what is happening is
turn radio off
hold [HOME][FUNC] keys
turn power on
no reset! it just goes to normal operation without resetting anything
Thanks
Roger Gray

4760. FT-100 vs. IC-706?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-05 17:11:03 UTC
From: John Newell
Topic: 4760 Message: 4760

No, wait! Please don't flame me yet! <g>

I'm interested in comments on these two radios for HF use, both mobile and as a pseudo-base rig. I plan to do both.

From playing with the radios a tiny bit, they seem somewhat comparable in many ways. The FT-100 has a clear edge on both rx range and tx power, which are significant pluses. According to the reviews on eham.com, both have some QC issues. :-(

One factor I haven't seen any comment on is power consumption when used non-mobile and off the grid -- does one of these rigs use less power when set up on a battery or a solar (or whatever) alternative energy source?

What else should I be asking/knowing? Hopefully, this isn't the 413th time this question has come up...

Thx & 73,
John Newell

John:
Actually, this question has come up a number of times in the past. You should probably search the archives for such references as I'm sure there is much in there to answer your questions. If you have more specific questions you'd like to ask, I'm sure we can addres them. Since I have both radios (IC-706 MKII in my wifes van and FT-100 in my truck and another going into my boat) I should be able to answer those questions.

You mention that the FT-100 has better output power than the IC-706?. I assume you mean the 706G in reference. I have had several of both models in the last year and a-bit and can say that in my case the 706G had more output power by 20% easy over the FT-100 with less heat (Constant 80-100 watts output on average normal audio. FT-100 was around 60-80). In regards to RX range, the FT-100 has better coverage... but remember that the sensitivity is not great when out of band. As for Q.C. concerns, the 706G I believe at least in my opinion is not an issue as was the FT-100 to-date (How many more "updates" can you have not to mention the two that smoked on my desk at first release from poor P.A. design in the 2/70 section! The 706 has been refined with it's "G" model). Today both are pretty good performers for what they were designed for, an" All-in-one hybrid mobile"! I'm sure things will only get better in the coming years!

Actually, you can have it both ways. DX4WIN allows you to assign a group number to a log and pull up the logs individually or combined. So, you can view your fixed station stats, your mobile stats and both combined.

I also use the group number feature when importing my contest logs
from TR Log.

DX4WIN has replaced LogEQF which I used for a long time.

FT100 users and all mobile ops should be very careful to not attempt any logging while in motion, other than running a recorder. We are going to get pressure to even be in contact while in motion, as is evidenced by the cell phone discussions.

There is one more RARE method of mobile logging... I have persuaded my spouse to write the essentials in a notebook on occassion. That would be "let someone else do it".

I was also intrested in Tony's note about DX4WIN, I have almost all of the popular loggers, but not that one. I am going to see if they have a demo to try. For me, the main thing in a logger is the speed and ease of the entry of a single contact.
CT's method wins that one for me. Others have configured in the same manner, as has my current logger, WriteLog. Next in importance comes the ability to separate operations, then combine, or export them to a Database. DX4WIN sounds like a candidate there.
Thanks for the reference.
I have used my FT100 in several contests, and in some high duty cycle operations from island locations. It just keeps on crankin'. There are a lot of things that could be better, but over all I am happy.
Given the range of strange things that could and have happend to some, I am glad to have a forum to look up any anormal behavior, and possible fixes.
I have also found that in other Yaesu products the S/N was the defining mark for determining when some major changes were made at manufacture. Like CPU changes.
But if it aint broke, etc... just be aware of the odd things that have happened to others..

From: Tom Tishken KD4WOV(laptop)
Topic: 4774 Message: 4775

well that will vary from operator to operator, but here is mine.

Mic gain: 30
Compres: 20
Fm mic gain: 30
Fm deviation may work better at 2.5 than 5 on most bands, but that depends on the repeats and receivers. I have one repeater that at 5 it will over deviate on the receiver although it is only measured at 3 kHz. the 2.5 is a safe bet for FM. I use this setting on 10 meters - 70 cm.

Subject: [FT100] Audio Setup PLease Help

My Groups | FT100 Main Page | Start a new group!

Rather than clog the crowded HF bands with test signals or bug my fellow Hams with "hows that" , "what if I do that" , "Is that better" for hours,
I
was wondering if someone could give me suggestions on a good audio set up. What Compression setting , Mic EQ etc.... I want a good, loud , DX audio....
My usual Setup for speaking is Mic 6 inches from mouth. Medium Voice level.
Medium pitch !!!!

Cheers MW5EPA Rob , Wales

4776. RFI problems

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-08 20:25:55 UTC
From: wolobmp@hotmail.com
Topic: 4776 Message: 4776

Hello, well I now am experiencing what we all know and dont enjoy solving is the dreaded RFI. Setup: FT100 with ATAS100 antenna mount Diamond K400 trunck mount with large braid strap from under hinge of trunk to frame....heavy grnd starp from one mtg screw of case of radio to bolt under passangers side seat. Toroids placed on pwr leads, hf coax, mic cable, external spkr (sheiled cable) cable. Also using K400 Diamond mount with SG7900 2mtr/440 antenna. Pwr cable directly connected. SWR on 10mtrs is obtainable then when PTT is pressed(such as in fm mode) swr icon error icon comes on, somtimes, and sometimes with full output but swr icon still showing. Unit was sent to Yaesu for swr/error fix. Result:rf getting back into my xmit audio and can even "hear" myself within the vehicle...possibley thru stereo? FT100 is abt 1 month old ATAS abt 2 weeks. Also, 40mtrs when xmitting ssb dash board "idiolt" lights randomly flash and one idicator stays lit til vehicle is shut off and restarted. Called Yaesu:was told maybe a grnd loop or radio problem. My last resort Radio Works has an item called line isolator #4k-lig place this inline and connect with grnd lug. Looking for comments, suggestions, assistance.....or simply your opionions. Please reply here to postings is ok...as I will hope someone might have an idea I havent tried yet. This is a multi problem but mostly oringanting from stray RF---I think. final note vehicle is 98 chevy cavaliver. Looking forwd in the replies. Thanks much Mike.......WD8BMP

hi chris, yes i am familar with your problem i solved mine by getting a
short lenght of cat 5 3pair cable and a rj45 6 conductor plug (i think
that was the proper number) then i attached the rj45 and a 8 pin
mike plug to the cable wired for the mike i had and away it went worked
like a charm.

Hi, Chris;

No, I'm having the same problem, for both FT-100 and FT-90. The latter is particularly
frustrating, as it's such a great mobile rig but you know the problem with using
handheld mikes in the UK now!

If I hear of anything, I'll report back to this and to the FT-90 reflector.

Bob, G8IYK

http://www.qsl.net/w2blc/100.htm

Go to the above site and there is a HEIL Adapter Cable Fix which will show you how to take care of the problem. After making the mod, any mike that works on the Yaesu 8 pin scheme, will work on the FT-100 using the Heil adapter.

Hi, Erwin,

Not as specific legislation, but a considerable tightening of the application of parts of the Road Traffic Acts which relate to "not being in full control of the vehicle". Virtually all the publicity so far has related to cellular 'phones, and there has been high-profile publicity of several succesful prosecutions, including one of a driver who took a bite of a sandwich while stationary at red traffic lights.

As someone who drives everyday in the UK's second city, I'm fully in favour of the clamp-down as it relates to *handheld* phones. I'm constantly amazed at the number of 30,000UKP cars I see being driven one-handed because the driver seems unable to find the extra 50UKP for the hands-free option!

So nothing aimed specifically at ham useage, but it's obviously included in the current "purge". I do wonder to what extent the drastic drop-off in mobile operation in the UK has been caused by this, and also by the trend towards microphone connectors like the RJ types which are relatively unfriendly towards home construction.

I'm just come back from a Mobile Rally and there were an amazing variety of earpieces with boom mics, single earpiece headsets with boom mics, bone-conduction earpiece/microphones, and even throat microphones, but *all* for HTs, or for PMR.446 (similar to FRS) handies. Nothing off the shelf from the big three Japanese manufacturers, in spite of them manufacturing dedicated mobile rigs such as the FT-90.

Yaesu, with your FT-100, FT-90, and (soon) FT-817 - are you listening?

Bob:
I'm also in agreement that something needs to be done about people who operate a vehicle with less than total attention to the task. However, if anything is going to be done, then the whole problem should be addressed rather than just a couple high profile items. Rather than just passing some legislation to say that they've done something but doesn't solve the problem, let's consider the following.

1) Ban use of manual dialing Cell Phones.
2) Ban the use of hand held microphones on radios, including those used by public safety officers.
3) Ban the use of AM/FM or other broadcast radios that require any manual interaction.
4) Ban the use of any heating or air conditioning control, windows, door locks or other manual appliance in a vehicle.
5) Ban smoking in vehicles (my parents were nearly killed by someone lighting a cigarette.
6) Ban talking to a passenger in a vehicle.
7) Ban any other thought process that is not directly relavant to driving.

OR

Simply make people responsible for their actions!

You bet!!

And I'd like to add one observation....

I really believe that if you can not drive a car with one hand on the wheel while doing something with the other, like using a phone, mic, changing stations on the radio and etc then you should not be driving.

People who must concintrate so hard to drive a car that they can't do anything else are a major problem.

Taking your eyes off the road and vicinity while dialing a phone number, reading a map and etc is a problem and needs to be addressed.

But the rest is nothing but more feel good BS.

Having driven well over a million safe miles in a truck makes me believe that I just might be right! :-)

OK, now I feel better!

No, same as all other Yaesu rigs in the European market, unfortunately,
up to and including the FT847.

The manual for my new FT-90 has a stuck-in notice in the front apologising
that parts of the manual may not quite make sense because a different
microphone has been supplied!

I have had similar problems with the Ft-100, ATAS-100 installed in a 1999 Kenworth T-2000. All the gauges are run from the engine computer. If I try using 40 meters, even with the engine off, the gauges jump around erratically. I have not really tried some of the tricks that need to be done to avoid the problem. Figure some torrids on coax will help it I get to it.

I had similar problems, not just with the FT-100 and ATAS-100 though, but with previous rigs and antennas as well. On my Ford Explorer, transmitting on 40 would play havoc with the cruise control. Solved it with better grounding and ferrite beads on the DC power cables at the back of the rig.

Do you filter the DC power lines in common mode (both lines through one ferrite), or individual ferrites for each power line, or just the positive.

From: Tony Cioffi
Topic: 4800 Message: 4800

Hi FT100'ers

I installed my rig in the car (Honda). Grounded the antenna with tinned flat braid to the chassis. One thing I don't understand. Why is it when I open the hood the S5 engine noise disappears from the rig. The second I close it, it comes right back. I have a braid from the hood to the chassis as well. Not sure what else to try and ground. I will point out that the NB in the rig is absolutely superb. It eliminates all the noise beautifully. I prefer to clean it up manually first before relying on the NB. Any suggestions ?

Gary,
Both power lines take a loop through a single split ferrite bead (Palomar Engineers - material 43, model FB-56 I think) held together with a cable tie - i.e. So, yes, common mode.

4803. It finally happened

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-13 21:27:25 UTC
From: Chuck Harding
Topic: 4803 Message: 4803

My FT-100 came down with the HIGH SWR Icon on 10 and 15 Meters. The 2 meter transmit side went south. Can hardly make the repeater with 50 watts. I have it boxed up. Waiting for Yaesu to tell me to send it back. 11 months with no problems. Hope they fix it right.

4804. Microphone Adapter from Yaesu

From: Anthony R. Gargano
Topic: 4776 Message: 4805

I measured 81 ohms of resistance between ground on the ATAS-100 and ground on my vehicle body. The culprit was the K400-there was 81 ohms between it and vehicle body ground. The set screws to ground measured zero ohms, so I knew I had good contact there. If you take the K400 apart you'll find paint to paint and metal to paint contacts at key points where there needs to be continuity for ground integrity. I used my dremel tool to remove the paint/anodized surfaces and insure metal to metal contact for purposes of ground continuity. After doing that the mount to body ground measured 0.1 ohms. You might take a look at that. Tony N2SS

4806. Operating the FT100 using CAT

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-14 18:36:38 UTC
From: jminerd@zbzoom.net
Topic: 4806 Message: 4806

I have written a Visual Basic program to communiccate with my Ft100. However, the FT100 chapter on the CAT System programming, to me, is not very clear on what some of the Opcodes do. My problem now is trying to understand what the P1 in the Status Update command is real or not. When I put numbers in this byte position nothing seems to happen. I get the same response all the time. Therefore I believe this to be a error in the manual. The other problem is trying to interpret the frequency HEX information prsented in the Status Updates byte sent back after issuing a Status Update. Anyone out there know how to convert the four bytes that represent frequency into frequency? I haven't been able to figure out the trick yet.

4807. RE: [FT100] Operating the FT100 using CAT

Yahoo group: FT100 (1998 — 2000)

Topic: 4806 Message: 4807

Hi!

I've done quite a bit of VB programming for my 990 which also uses CAT.
I was planning do work on the 100 soon but haven't gotten around to it
yet, so I can't help you with the status command.

Here is the logic I use for reading the frequency:

From the radio, VFO/memory data comes in 16-byte 'update structures'.
The frequency data starts at the 2nd byte (byte 1). I do something
like this:

```
FreqByte1 = bytes(1) ' base 0
FreqByte2 = bytes(2)
FreqByte3 = bytes(3)

FreqHz = 10 * ((FreqByte1 * 65536) + (FreqByte2 * 256) + FreqByte3)
```

The logic will be a bit different on the 100 since it covers more than
HF - Looks like you have to shift all this and add the 4th byte:

```
FreqByte1 = bytes(1) ' base 0
FreqByte2 = bytes(2)
FreqByte3 = bytes(3)
FreqByte4 = bytes(4)

FreqSteps = ((FreqByte1 * 16776960) + (FreqByte2 * 65536) + _
(FreqByte3 * 256) + FreqByte4)
```

Then I notice from the manual that this is 'steps' at 1.25 Hz/step so
mutliply by 1.25 (be sure you use doubles) will get you Hz:

```
FreqHz = cdbl(FreqSteps) * 1.25
```

I did the math from the HEX in their example in the manual and got
970MHz as they did.

Hope that helps!

I'd like to build mine into a small back pack also.

What I have noticed is that when I use a 5A 12 gell cell battery, it doesn't last long at all even in receive mode only. I was considering building a battery pack that would have a voltage more near the recommended upper limit... My radio seems to die at about 12.5V

Keeping the unit cool and preventing the constant flexing of the wires on the back of the radio is a priority for me.

Gee, add a tiny TNC.... Palm size terminal....
This could be fun!

I am still in research mode on this project.

The Ft100 in the receive mode draws 1.3 amps in standby and almost 2 amps when receive audio is active and the volume is up. Then on transmit the rig draws up to 22 amps!!!! Therefore to run for about an hour you need at least a 30 amp 12.8 volt battery. Now to keep the weight down I would look at the lithium type batteries which pack a lot of power for there size as used in the latest VX-5R AND CELL PHONES.

Lithium-ion batteries have pretty high internal resistance, making them hard to use in radio applications, though you can engineer around the problem.. They are also quite explosive, so the legal department makes you install protector chips with the batteries. [A notebook computer with lithium-ion batteries has the equivalent explosive power of two sticks of dynamite.] The legal problems also get in the way of the hobbyist using these batteries since there is no follow on business, and who wants to go through the legal hassles to sell a couple of batteries. I doubt you can buy the raw batteries without having some sort of industry connection. If you really want to pursue this, I would try Polystor
http://www.polystor.com/
The company is much smaller than the major battery suppliers, facilitating interfacing with them.

Generally, most companies charging lithium ion batteries use an electronic fuel gage of some sort. This will turn out to be a much bigger project that you thought.

The real question I always had is why is the standby power on mobile radios so damn high. The FT100 is pretty typical in this respect.

I had a similar challenge using a laptop on a long flight to Japan. Although the unit used 12v, the 12v gel-cell pack dropped below the lower limit of voltage quickly.

My solution was to make a 20 D-cell pack. The 30v was put through a switching regulator for efficiency. It would last and last because as the cells depleted they would drop from 30v down to 12v.

Of course you need to keep the FT-100 at QRP levels because the regulator won't handle more than a few amps.

This is very similar to how notebook computer power supplies work, i.e. you build a battery stack then buck the voltage down with a Dc/DC converter. I'm assuming you used alkalines. If so, they are considered at end of discharge at 0.5V, but there is nothing wrong with cutting the stack off a little early. If you are using nicads, then the end of discharge voltage is 0.9V per cell. Beware that many D size nicads are really C size nicads in a shell. You are better off using C's and building a bigger stack if you D cells are fakes.

You can build the regulator to handle the FT100 amperage with modern chips, though I've never done this at 12Volts. [Most high current DC/DC are designed for microprocessors which are around 2V.] I'm not sure how well the radio would work with the DC/DC noise. There are fixed frequency DC/DC chips that will work, but not necessarily over a wide dynamic range of current. The fixed frequency design keeps the birdies in known spots. Most of the chips have a sync function so that the switching freq can be set accurately.

Hi all-

I just recently joined this reflector and I am looking for the answers to some questions about the FT-100.

I am going to be buying either a FT-100 or an Icom IC-706MKIIG soon. I am trying to get the straight information on the Yaseu (does anyone else find the Yaseu sales literature a bit obtuse?) from the experts on the list. I'm sure these questions have been answered on the list before (I did poke around a bit in the archives) so I apologize in advance for the bandwidth.

1. Does anyone know if the FT-100 meets NITA specs on HF? On VHF/UHF?

2. What is the actual transmit coverage on VHF-UHF after "THE MOD"

3. My VX5R is deaf as a post form about 200 MHz to 400 MHz even though it advertises receive coverage on this range. Does the FT-100 actually hear anything in the extended Rx ranges outside of the 2 meter and 440 bands.

4. How is the Intermod performance in the VHF and UHF ranges?

5. Can the FT-100 be computer controlled or can frequencies be downloaded from something like the ADMS software?

6. What are the dimensions of the detachable front panel?

Thanks again for the bandwidth and thanks in advance for the help

4824. Mounting an ATAS-100 on a pole

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-17 10:36:06 UTC
From: Cohn, Derek
Topic: 4824 Message: 4824

Dear All,

I have finally found a permanent home in Melbourne, Australia and moved in yesterday. Today, I tried to install my ATAS-100 in a permanent location. I thought a little elevation might help my cause here. I bought a 11 foot copper pipe and attached the pipe to the house. Using a mobile bracket, I mounted the ATAS-100 at the top of the pipe just above the roof line. It tuned once on 20M and then it wouldn't tune on any band (including 20M after that initial success).

I lowered the bracket on the pipe until it was about 3 feet off the ground and it tuned up on every band. Is there any way to get the ATAS-100 up in the air and have it tune? I'm assuming I have a ground plane problem. Should I just keep the antenna low on the pipe or does anyone have any suggestions for getting it up above the roof line?

Thanks for any help you can give me!

Do you have a ground or a counterpoise? If not, and possible, drive an 8 foot(?M) into the ground at the base of the mast. Or run some ground radials out depending on your area resources. HF antennas really like a good ground plane. Good luck and let us know what happens. Adam

4829. ATAS-100 with intermittent receive on 40

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-18 05:25:46 UTC
From: Charles J. Gyurina
Topic: 4829 Message: 4829

I have been using the FT100-D and Atas-100 on a Honda Accord for about a month now. It works great on transmit, but seems to have a problem on 40 meters on receive. Sounds like a loose connection as the receive drops down in strenth as I drive over bumps. Does this antenna have a mechanical problem when fully extended? I have tried two different antennas with the same results on 40 meters! Yaesu says it the K-400 mount, but the mount is fine and I have extra grounds to the car chassis. If I tune the antenna to 40 meters and then shake the antenna anywhere near the rubber boot the signals and audio become intermittent! Can this be fixed, or do I need another antenna? Thanks for any comments.

73, Chas, K2BU

Yaesu is incorrect when they tell you that it's your mount.
The problem with the ATAS-100 with 40 meters is that if
you were to extend your antenna for 40 meter operation
and then push the rubber boot up to expose the inner
workings of the antenna, you would see the coil and at the
base of the coil, where it "screws" into the rest of the
antenna, you'll see two "clips" on each side of the antenna
that are held in place with screws. These two clips are
essentially springs that press against ball bearings (two
per clip) and push the ball bearings against the loading
coil. When driving on bumpy roads the whip and coil assembly
bounce around and the ball bearings momentarily loose
contact with the loading coil. Eventually the "clips" loose
some of their tension and the receive problem becomes
noticeable on other bands and when driving in general,
whether the road is bumpy or not. Some people have taken
the "clips" off and bent them in a little bit to add more tension
and then slipped a rubber O-ring on top of that to reinforce it.
Hope I've explained it well enough and hope this helps you.

From: Jim
Topic: 4830 Message: 4831

The antenna uses four small ball bearing to make contact with the coil. The wire on the coil is about #22. The coil form is about 3/4 inch in diameter fiberglass. It appears that the ball bearings could break contact with the coil. The ball bearings are held in place with two spring clips.

4832. FT-100/ATAS100 ANT-ERR message

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-18 14:11:05 UTC
From: Mark Levine, D.C.
Topic: 4832 Message: 4832

My FT-100 was giving me an intermittent ANT-ERR message this weekend and would not tune. I disassembled the Comet CQ5M mount to find the RG-174? frayed and just about fell off the SO-239. (Oh and this with only 6 months use!)

I attribute the problems to a solid center conductor RG-174 (I think that's the real thin stuff used here).
Question: Is there a braided core 174 or another rather thin coax I can switch to next time it inevitably fails that is more flexible. I like to remove the antenna in parking lots hence the quick discon mount and the wear and tear on the coax. Suggestions?

4833. More RFI Problems ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-19 08:32:15 UTC
From: Rob.Hammond@eu.sony.com
Topic: 4833 Message: 4833

Also using the Combination of the FT100 & ATAS100 on a TRIMAG mount with a braided earth wire from the Magmount to vehicle chassis. It tunes fine on all bands but I get the Micro Error on more than 50 Watts on 20M. Works fine everywhere else. I put extra Ferrites on all wires & re-routed the coaxial well away from them but it didn't go away. On earthing the set as well I got the error on all bands it became much worse not better.
I'm going to get the multimeter out tonight but all contact are good metal -> metal. Any other suggestions to look at while I'm there ???
Also, I notice when I try to use the second jack (VHF/UHF) for my other antenna which is mounted on the boot (ATAS2 mode is Selected) The ATAS100 will not tune and the VHF ant is way out on SWR. Unplug the HF Jack , VHF works fine. Unplug the VHF jack & plug the HF back in & wow , ATAS works fine. I've tryed the both plugged in without the antenna plugged in the VHF magmount but no joy here either. I'd really like to get both antennas working at the same time as when HF is dead I can work the local repeaters. Any Ideas ????

Cheers Rob MW5EPA Cardiff , Wales

Hi Gang,

I was curious about the length of the ATAS-100 antenna, both the coil assembley and the overall length with the whip. I've did some searching to different web sites and I haven't been able to find any mechanical specs. I would think it would be in the owners manual, so if somebody would take a look and either post it here and or email me privately I would appreciate it. I'm concerned that it will bang on the garage door when I drive in.

I tend to think that there are other opcodes available. I also have a Yaesu FT-757GXII and think it has others as well as the ones listed in it's manual

For example. I ran my TRX-Manager software and in error used the FT-100 radio selection on my FT-757. (i.e. the program sent the codes for 100 to my 757). Now I have 100 Khz set on the VFO instead of the 10Khz that is documented in the 757.

I'd love to get the 757 back to 10Khz for finer tuning, but don't know what the code might be. The 757 documents continues opcodes 01h to 10h and no others. The 100 documents several opcodes but there are big gaps in the numbering system. I often wonder why a company is so close to the vest on this kind of information. A GPS mfg (Garmin) was pretty much reversed engineered and had wonderful third party support. I can't help believe that this is one of the major reasons why it is so popular (also consider the open PC versus the proprietary MAC)

If I new how to reset default settings, I'd be brave enough to experiment, but alas, I see no 'hard' reset for either radio.

Haven't seen any answers yet.
A automated assist to a manual load might be to write a
program that loaded all settings to the VFO, and with
operator intervention advance the memory number and V>M
using the face panel butons. (Yeah, not what we want, but
certainly easier that dialing, punching, dialing, punching,
storing...

I've done a lot of CAT programming with my FT990 and it
has a nice feature where querying the 'status' returned
a string with the model # of the radio (09H 90H in my
case) which was really convienent. Too bad the 100D
doesn't do that...

From: Will R
Topic: 4847 Message: 4847

I am getting ready to drive an SB-200 amp with my FT-100.

I think I will use a solid state relay, but not sure if there is some design requirements I need to know before building it. Do I need voltage spike suppression on a solid state relay input (as I would use on a mechanical relay)?

Is there a special circuit I need to isolate the AGC between the radio and amp? Do I even need to run the AGC?

Thanks in advance for the advice!

<Please do not mistake this for a flame... just a warm message
I have made this complaint before, and the emotion is long gone. My experience with Yaesu (only) prompts the following.
We keep re-discovering that the people who do the mpu/cpu code in the new radios have no clue at all. Not one. And they are so poorly paid they cannot even purchase one. Nor would the manufacturers allow a clue on site.

The manufacturers have learned over the many years how to put enough buttons and knobs on the front. They have even faced up to a few features on the back. But the computer interface continues to be an object of ridicule for Yaesu. If it is not a "curb appeal" feature, visible from the front, it will not get much attention. So a high speed, comprehensive, non polling, fully symetrical interface will not happen. Much less an interface that semi-matches other radios in the same line. This applies to the hardware, --- null modem, no null modem---- and the software... multiply by 1.25. Symetrical just means each feature has a "Get" for each "Set". Comprehensive means inclusion of a largely similar set of methods, including the ID feature mentioned in a recent note. Hi speed means 56K, Ethernet, or USB.

That is a good start. Perhaps I should check out a non-front panel radio. There are a couple of them out there.
<End of warmly worded message to Yaesu... (without spell check)

So, Yaesu, why don't you get the message? Anyone listening.

Subject: Re: [FT100] Operating the FT100 using CAT

I tend to think that there are other opcodes available. I also have a Yaesu FT-757GXII and think it has others as well as the ones listed in it's manual

For example. I ran my TRX-Manager software and in error used the FT-100 radio selection on my FT-757. (i.e. the program sent the codes for 100 to my 757). Now I have 100 Khz set on the VFO instead of the 10Khz that is documented in the 757.

I'd love to get the 757 back to 10Khz for finer tuning, but don't know what the code might be. The 757 documents continues opcodes 01h to 10h and no others. The 100 documents several opcodes but there are big gaps in the

numbering system. I often wonder why a company is so close to the vest on this kind of information. A GPS mfg (Garmin) was pretty much reversed engineered and had wonderful third party support. I can't help believe that this is one of the major reasons why it is so popular (also consider the open PC versus the proprietary MAC)

If I new how to reset default settings, I'd be brave enough to experiment, but alas, I see no 'hard' reset for either radio.

Will,

check out the May issue of CQ, maybe 96 or maybe it was 97 , I forget. There is a story and simple circuit to control boat anchor amps, with out smoking the transmit control chip. Mine worked great between my old Icom 706 and Dentron LA1000B.

I know people have had problems mounting the ATAS-100 on a pole, what are the thoughts of mounting it on top of a patio umbrella pole? Would the tines of the umbrella be a sufficient ground plane for the antenna? Mine has a cast iron stand, directly on the ground, so it should have a sufficient base. Any thoughts?

This is of interest to me as well. I have a Dentron MLA2500A. Beautiful amp. I use the Yaesu FRB-757 (schematic available) with my Yaesu FT-757GXII

It has a simple diode, resistor, transistor switching to a physical relay for the Amp. This handles the transmit relay in the Dentron just fine.

Where I have concerns is the ALC voltage and current. Both of my newer rigs are negative going (0 to -5vdc for the FT-757 and 0 to -4vdc for the FT-100); the amp also states it's negative going but does not state a voltage/current that it provides.

I have connected the ALC (on a day I felt I could afford a repair bill) and it appears to function fine and continues to work as far as I can tell

If any one finds the info in CQ, I would be interested in it.

Glenn, KG7IL in Renton, Washington.

Mike,
You are so on-target with this. Lack of consistency, lack of understanding, lack of INTEREST in computer control have hobbled the Yaesu line among many amateurs for some time. Manufacturers of scanners learned long ago that computer management of memories -- even if just downloading and storing -- was essential to the appeal of their products. Contesters know that compatibility with logging software is a sales point.

Having a xcvr with 300 memories sounds great, but if you have to enter them all manually and scan in increments of 50 (ala the FT-100) they are almost more trouble than they are worth. Let's hope Yaesu, which DOES "get" the radio part, will make their future designs a bit more holisitic in terms of fitting into the modern operating environment.

I guess it depends on the operating frequency and how big your umbrella is!
Since radials should be a quater wavelength or multiple thereof, my guess is
your frequency range is rather limited. Also the spacing between the bottom
of the antenna and the "radials" will have some inpact.
Good luck, Adam

4854. Memory entry by Computer

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-22 13:05:15 UTC
From: Duffer
Topic: 4854 Message: 4854

Hi all.
Is there any software available to allow me to enter and manage the
memory channels on my FT-100 ?
What about plans for a homebrew interface ?
I find the pingerpokin method of memory entry by the front panel of the
radio very clumsy and time consuming.
Please cc your reply direct to me by e-mail
Thanks !

4855. FT-100...I'm not impressed.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-22 14:09:43 UTC
From: Duffer
Topic: 4855 Message: 4855

I'm a newbie here on the listserver...perhaps I'm echoing the sentiments of others but here goes...

I recently bought a used used FT-100 from a local dealer and soon discovered that the UHF TX was intermittent.
The radio is installed in my car...the head up front and the main chassis in the trunk using the (not cheap) remote kit.
I use an outbacker for HF and a Diamond dualband antenna for V/UHF.
The UHF TX problem would come and go intermittently. After a few months of operating and blaming my antenna, feedline and the repeaters I was using, I put my Bird wattmeter inline and sure enough, when the problem occurred, the radio was putting out less than 1 watt on UHF.
Fortunately, my used FT-100 came with a bit of a warranty. I took the radio in for repair and they told me that they had to replace a diode, a transistor and fix a cold solder joint in the UHF low pass filter section.
Now that the radio is out of warranty, I'm curious to know if this is a chronic problem that I might expect to have to deal with again. I have heard that the ATAS-100 antenna can cause problems on UHF...Perhaps the previous owner may have been using the rig with one of these antennas. From what I understand, water would get in and not drain properly from inside the antenna, thereby causing problems with the tuning electronics. I suppose that the mismatch would wreak havok on the output stages of the radio (esp. on UHF from what I hear). I hope that by NOT using the ATAS antenna, I won't have any further problems.

Aside from the above problem for which I understand that since I bought a used radio, it could possibly be an isolated instance, I have to say that I'm not really impressed with the FT-100. It has the operation and feel of a 'toy' radio. I especially find the memory entry and management very cumbersome. I'm told that there is nothing out there in memory management software since the software commands and technical info aren't there.

I see that Yaesu is now marketting the FT-100D which is supposedly a dressed up FT-100 with some options included as standard equipment. I wonder if it's REALLY a complete revamp of the boards to make the FT-100 work as it should have in the first place. (ie...the distinction of the D model separates the lemons from the apples)
Did they bother to improve the CAT interface for memory management in the FT-100D ?

My last mobile rig was an IC-706. By comparison, I must admit that I liked the user interface, memory management, audio quality and general operation of the 706 better than the FT-100. I'm now considering selling this FT-100 and looking at an IC-706mkIIG.

Comments welcome. Please cc your reply to me directly by e-mail.
Thanks...Hugh VA3TO

Topic: 4856 Message: 4856

Jim, You also hit it on the nose. Maybe customer studies have shown that the weighting factor of CAT is small. For me, the selection is a balance of all the features that I consider important. My last three radios had to have a PC interface.

CAT is important
I have several radios acquired over time. Most are Yaesu. However, I purchased a Kenwood TH-D7A, got the (G) upgrade and have used it extensively with the PC. The #1 reason for the TH-D7A was it's radio/TNC/PC integration. It has not disappointed me.

Among the list of my equipment, the ones I use most have computer interface/control. FT-757GXII, FT-100D, FT-90R, VX-1R and the TH-D7A all have computer interface. All of them are PC active. I have an RS-232 switch box set up with the appropriate cables to make it easy; if it's not easy I wouldn't use them as much. I'd like to see a docking type setup for quicker set up. Maybe even USB or Firewire since RS-232 seems to be on its way out. (Yes I know that their are USB/Serial adapters, but at $80 a port that's ridiculous). Perhaps a standard interface to the radio, like the radios TNC port would obviate the special cables for each rig.

The TH-D7A has quite a hobbyist following in exploiting the computer interface. The newsgroup even has participation from a Kenwood employee. The Memory Channel Program (MCP) was posted on their ftp site, the manuals are dowloadable. Kenwood seems to fully understand that the market is also computer literate (or has help close at hand).

I actually let the CAT influence my purchase of my most recent HF rig. The Icom 706 and Yaesu 100 were at the top of my list after checking out all the little rigs. Since I knew that I could buy a Yaesu cable and plug into my TRX-manager, I knew I would be off and running a little quicker. I also have this mis-guided impression that Yaesu might treat me a little better since I have a Yaesu FTDX-560, FT-757GXII, FT-100, FT90R, VX-1R and (2)FT-470's. (OK Yaesu, I have done my part, now open your secret book and share it with all of us owners, then talk to me about what I want).

Memory Groups
Jim, you mention the scanner manufacturers; I have two scanners that allow easy access to 'banks' of memories. Something I have missed in the ham radios that have lots of memories. I was happy to see the Group Memory and Active memory feature of the 100. Still, it's not quite there yet. I have not yet determined how I will use these Groups. It appears that only one Group can be active at a time. I have found my self in the wrong group, trying to get back to my group while on the road can be frustrating.

My scanners allow me to have one, some or all groups active in the scan. This allows me to have a global group, regional group and local group settings For example: bank 10 is used to set up any local frequencies that I find, I know that I can over-write these on each trip without affecting my other memories.

Also, is there some neutral format that the industry could settle on. I have no problem with a proprietary format for the manufacture, but having a software adapter to read/write other formats would be great, The PC Genealogy software companies have done that and followed the lead set by Microsoft/WordPerfect/RTF. That way, once Yaesu allows us to CAT our 300 memories, we could share files for regional/local settings.

On the plus side, since we do have CAT, we can make up for these shortcomings via software. TRX-Manager allows me to enter and store as many Memory Groups as I want as PC-data files. TRX-Manager will scan my memory groups. Great for home, not so good in the car where I do not have a permanently mounted PC. If any of you have not used the TRX-Manager, I would heartily recommend it. It really is fantastic. It breathed life into my old Yaesu FT-757GXII. The software implemented bandscope (actually band sweep) is great. The quick memories are similar to the FT-100s, now I have them on the old 757. Laurent Labourie, the software author, frequents the mail-list and is incredibly responsive to the user community. A shining example of customer service. With his experience with so many radios and the CAT features, he would make a good sounding board for any radio manufacturer interested in actually improving the CAT features.

TRX-Manger also helps me manage the radio's settings. Most of the features are a click away, rather than buried in menus.

Configuration Settings
Perhaps, the radios could be designed with a few 'personalities'. I would like to see at least three buttons

that have programmable profiles (and a few default) that would store sets of configuration parameters. I get a bit frustrated going through the same steps each time and then going back and un-doing those steps for a different situation.

My Nikon camera allows me to set quite a few configuration items and it's easy to get 'lost' in the configuration menu. While Nikon gave me good control over all of the attributes, it's menu system is quite extensive (like the FT-100) and setting it's configuration can take a bit of time (like the FT-100). The Nikon N-70 has a 'default' profile that restores all setting to factory with a button/dial. Three settings are use programmable and allow me to return to a suite of settings with a quick selection via the button/dial. If I want to go to Aperture Priority, spot exposure ..... It's just a quick selection for all of my favorite settings.

For those of us that use radio scanners, camera's, PC's and such, we see great room for improvement. This does not prohibit me from enjoying all the features that we do have, I love them. I wish my Dad, W7MS-silent key, could see what's happened since he died in 1985. I'm sure that he would be amused at our finding fault while he marveling over the VX-1R and FT-100D.

So let us enjoy what we have and find a way to get our comments to the manufacturers.
73 from KG7IL, Glenn in Renton, Washington.

Nope, but depending on whether you have a installation
location or RF grounding type question:

here is a page from WA5SKM, who installed his FT-8500 in a
Lexus SC-400
http://www.primenet.com/~ddanz/ham_radio/index.html

and a page from KA6K, who installed a Mobile FT-100/ATAS-100
in a 1985 Mercedes 190E
http://members.aol.com/tomellett/ka6k/page4.htm

If it's a specific question regarding the RX300, I probably
can't help

Duffer:
Perhaps you'd like to expand on the reasons you get the feeling that it's a "toy" radio. I've used both FT-100's and an IC706MKII and don't get the feeling that either of them are what one could consider a toy. To the contrary, they both have some strong fetures. Personally, I like the FT-100 better from an ergonmic point of view. It's significantly easier for me to operate mobile than the 706 and the noise blanker and DSP has proven to be significantly better. I do however understand that everyone has their own things that they like and dislike. So, what is it in particular that bugs you.
As for the problems, I've had problems with both. Out of the two FT-100's and one IC706MKII I own, both one of the FT-100's and the 706 had to go back due to serious failures. The other FT-100 is running fine.

Hey guys-

I'm going to write the check soon!! I think I'm going with the FT-100 vs the Icom 706 but I'm still looking for info. Is anybody out there?

<< Hi all-

I just recently joined this reflector and I am looking for the answers to some questions about the FT-100.

I am going to be buying either a FT-100 or an Icom IC-706MKIIG soon. I am trying to get the straight information on the Yaseu (does anyone else find the Yaseu sales literature a bit obtuse?) from the experts on the list. I'm sure these questions have been answered on the list before (I did poke around a bit in the archives) so I apologize in advance for the bandwidth.

1. Does anyone know if the FT-100 meets NITA specs on HF? On VHF/UHF?

2. What is the actual transmit coverage on VHF-UHF after "THE MOD"

3. My VX5R is deaf as a post form about 200 MHz to 400 MHz even though it advertises receive coverage on this range. Does the FT-100 actually hear anything in the extended Rx ranges outside of the 2 meter and 440 bands.

4. How is the Intermod performance in the VHF and UHF ranges?

5. Can the FT-100 be computer controlled or can frequencies be downloaded from something like the ADMS software?

6. What are the dimensions of the detachable front panel?

Thanks again for the bandwidth and thanks in advance for the help

I'm an "old" member tired of this frustrating radio.
I sometimes think about trying an FT-100D, but the odds of getting bit again bother me.
I'm giving the FT-100 to my son and will go with the 706MKIIG.
What bothers me is that none of the 4 dealers (in Texas) I talked with, would admit to at least ONE
instance of FT-100 owner dissatisfaction. This of course didn't surprise me.

Why did I buy an FT100? After looking at the specifications of the FT100 and the Icom 706 MkII G, I chose the FT100 mainly because of it's greater receive coverage (important to me). The published information and for that matter, reviews I read did not tell me all the information I required, so I took the risk.
So far I am pleased with the FT100, but am disappointed that there is no direct frequency entry via the microphone keypad. The memory management is poor also. I have ordered the YSK-100 kit (which seems very expensive!) for mobile use. The cable arrangements for the Yaesu suit me better than the Icom as well.
The internal speaker is too small, but what do you expect in such a small radio? I never use the internal speaker on any of my radios, preferring external ones for their much better quality and volume. In the mobile, the audio is fed through the car audio system for the same reason.
As I have only owned it for about 2 weeks, my mind could change later, but I don't think so!

TX on 440 is 420.000-470.000 2 meter 140.000-174.00 this is on my rig

> 4. How is the Intermod performance in the VHF and UHF ranges?

In some of the worst intermod situations here in Jacksonville the FT 100 is able to filter out most if not all of the intermod. I have one other 2 meter rig that is unusable anywhere in town almost and the FT 100 is able to hear even weak simplex stations in the worst areas.

4868. FT-100D shortcomings

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-23 23:56:46 UTC
From: alan perry
Topic: 4868 Message: 4868

I dicided to buy the Ft-100D over the Icom 706MIIG and I am disapointed. I would have hoped to escape the bugs that plague this rig but haven't, 10, 12 and 17 meters are unusable due to its instability, so right off this rigs has low value to me. it has the infamous W ID as U(minor point here, but..), and the power output is 10-20 percent less than advertised. I have written Yaesu several times for a RMA and info concerning these issues and have failed to get a response. This is for those who wanted to know if the bugs are worked out in the FT-100D, apperently not. If these issues were resolved I think this radio has great potential, I like other aspects of this rig, but I cant even transmit on 10 meters in to a tuned yagi 60 feet up, but as it is.....

I have the same issues on my FT-100.

No need for an RMA, just send it in (properly packaged so UPS doesn't
destroy it.)

FWIW, I believe somebody posted that the FT100 uses tripple conversion for VHF on up, so I would hope the intermod problems are minimal.

Duffer:

I've had my FT-100 for about 4 mos. Although I have had no problems with mine, I agree with you totally about it being a toy radio. Cheap, squeaky plastic mounting of the front panel to the main unit, cheesy memory and scanning layout. Shitty pigtail wire quality. The Yaesu engineers should be embarrassed about this one!

From: Jeff Popa
Topic: 4872 Message: 4872

I find that if I try to receive a local broadcast radio station, WAKR 1590, I receive it fine if I use SSB and slope tune it. It sounds fine with good audio and plenty of volume. However, if I try to receive it in the AM mode, I get nothing. You would not even know it was there. I have all of the defaults set as factory. Also, I tried to receive our police frequency on 460.250. I got nothing with a good antenna, even though my HT brought it in fine. I used the FM mode. What am I doing wrong, or should I be concerned. I have had this radio for about three days. Thanks for the help in advance. Jeff WB8QYT

Hi Jeff.

My guess is that the Squelch / RF Gain control (mounted concentricly with the volume control) is set fully clockwise. The factory default setting is for this to act as a squelch control. If it is fully clockwise, then it probably won't open the receiver even on a very strong signal. On SSB it doesn't mute the receiver. Try turning it fully anticlockwise.
I have mine set as an RF Gain control but have to remember to turn it clockwise (max gain) on ssb and am, then return it to almost the other end of the range on fm so the mute works correctly.

I have used my ft-100 on all hf bands (not really on 160-no ant). Have had no problems. I use the atas-100 and a home brew screw driver mobile. Do lots of work on the warc bands, cw and ssb. Have had the rig just over a year now.

No problems here, glad I chose the FT-100

I bought the ft-100 D about 3 months now, and been having a great time with this radio.
the atas 100 antenna and the ft-100 D has been in my 18 wheeler and tunes on all the bands I have tried, the only band that I haven't tried is 160 meters.
I have had all good reports on every band, and the QSL cards to prove it.
All power out puts are up to max out put, I get the 100 watts, the 50 watts, and the 20 watts out to peak.
would you like to sell yours
Good luck with your radio

4881. high SWR fixed!!!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-24 19:44:28 UTC
From: remted@usa.net
Topic: 4881 Message: 4881

Have had my FT-100 since March 2000. Sent it in twice to Yaesu tech.
First time was high SWR on 10m,17m and NO output on 70cm.
They sent it back saying it was fixed and that they put in 70cm finals
as well as grounding straps.

Seemed to work for a few days then high SWR on 17 showed up again.
Sent it back in (per tech support AND they pay postage!?!?).
This time they put more grounding straps inside rig.
I suggested they drill and tap the grounds to the chassis. I opened
it up and it seems they feel the sticky tape they are using is good
enough.

Have been using it everyday flawlessly. Tunes up to one bar SWR on
each band, many, many strong signal reports on all bands.

They did send a refund check for full postage too.

Am using the ATAS (well grounded) with seperate 2m/440 ant.

Hope this is helpful.

I use my FT-100D with the FC-20 antenna tuner, the hustler with resonators for all bands except 160, and a outbacker outreach (12' 160-10 meters). I have had very good results, with one exception. That the FC-20 does not like stray rf. I had to put a choke on the Control cable to get it to work on 160, 17, 12, 10, and 6 meters. it seemed like the transceiver was oscillating, but it was the FC-20. When I turned the tuner off it went away.

Over all my FT-100D is an excellent rig.

Thanks for the nice report. I still haven't tried 80m. 40 meters is inconsistant. I have a large ground strap for my Tri-Mag mounted ATAS-100 but think that I still have some work to do on making my Dodge 2500 Quad Long Bed a better counterpoise. I should expect the big-ole-pickup to work 40.

Anybody else report success on 80m?

I thought about putting a coax switch to an 80 meter Hustler that I have sitting around, but would love to tune the ATAS-100.

From: Eric Dobrowansky
Topic: 4885 Message: 4885

Good Evening;

I just purchased a used ATAS-100 antenna second-hand. So far so good. It appears that my 10m oscillation problem is gone since I switched to the ATAS100. Unfortunately, no paperwork was received with the antenna.

Can someone send me a jpg scan of the instruction sheet that comes with the ATAS100?

Thanks

From: Duffer
Topic: 4886 Message: 4886

Someone else asked what I mean by 'toy'.
It's all in the look, feel and operation of the radio.

Look: Like comparing a toy walkie talkie to an amateur HT.
Too much plastic...like the cheesy plastic faceplate mount you get in the YSK-100 remote kit (Icom uses a metal plate for the 706). The TS-50 is slick looking; the IC-706 is rugged looking, the FT-100 is neither (to me).

Feel: You know...it's like the difference between shutting the door on a K-car and a Bonneville. There's this 'cheap' feeling to something with no substance to it. On the FT-100, the VFO knob has no wieght to it or flywheel effect behind it, the small rotary encoder selector has a lot of play (mine suffers badly from switch 'bounce'). Even the microphone feels light, plastic-y and low quality.

Operation: Clumsy memory management (including no computerized memory support), instability, low power output,
screwed up CWID...need I saw more !?

It sounds like there were a high number of 'lemons'...including out of box failures and problems that occurred during the warranty period of the FT-100. I'm further put off by the shortcomings of the FT-100 for which it seems they were oversights by the designers. Perhaps the 1+ year of pre-advertising of the rig before it actually hit the market put too much pressure on the designers and unfortunately, we, the consumers, ended up having to deal with this but it appears to have come back to bite Yaesu on the ass and I hope they learned a lesson from it.
A previous poster to this group made a statement that the dealers who seem to be pushing Yaesu products don't seem to be telling the full truth about how much of a lemon the FT-100 has really been.

I rate the FT-100 4th out of the IC-706, TS-50 and Alinco DX-70 in the categories of look/feel/operation. Some of you may disagree, but I know what I like and it's just my opinion. I bought my FT-100 to give it a test drive and be able to form my own opinion of it and I have to conclude that I'm not impressed.

Anyone wanna trade your IC-706mkIIG for an FT-100 ?

Yaesu tends to be first on the market, but their products are full of bugs. Some get solved. Some don't.

Plastic in itself isn't bad. Everyone complained about the Canon EOS plastic bodies. While everyone else was complaining, I bought one and had fun. In the end, they kicked Nikon's bu*t. in all categories. Plastic is fine for products you use in outdoor environments. Just ask any of the VX5 owners how hot their metal cased HT's get. They would love to have a good plastic body, not to mention a good CTCSS.

I'm still waiting for the new Kenwood rig to show up, then I'll decide what to get.

From: hugh
Topic: 4888 Message: 4888

I attended the Virginia Beach Hamfest today and met a gentleman who has programmed software for Cat Control for the ft-920 and 1000. I talked with him about the need for Cat Control for both the Ft-100 and Ft-900. He indicated both were being worked on and were needed. I am not sure if this was to appease me or is in development, however, I think if he received enough e-mail messages from this group, it would certainly influence his decision to support the ft-100. The software he had appeared impressive. I am attaching his e-mail and address for those interested. I also encourage all of us to email him with our needs. e-mail is: catcontrol@... and address is: Cat Control, Five Aberdeen Place...Woodbury, NJ 08096...hope this works...Hugh

Chuck,

Right now it is connected to the MagMount sheild lug and
runs down the back window to the top edge of the bed. The
bead has a ground strap to the cab body. I plan on tying
things together a bit better as soon as I can get some time.

Duffer:
So, I take it you don't like the FT-100?
The fact that you'd rate the FT-100 below the TS-50 for overall look and feel places your motives in question. You complain about things that are essentially irrelevant, like the plastic for the remote head mounting vs the metal on the IC706. It happens that this plastic mouting on the FT-100 is more stable than the metal one on the 706. I know, because I've mounted both and the FT-100 is the one mounted in my Hummer. It's neither flimsy nor unstable and holds the faceplate very secure.
As for flywheel effect, if you don't apply some drag to the knob on the IC706 it will drift on you in a mobile. I know, it's happened to me. If you apply drag, there's essentially no flywheel effect. I personally find tuning on the FT-100 to be well balanced for a mobile with a knob that size and have little trouble tuning it even in my truck. Also, my rotary encoder is just fine and I use it regularly. Are you sure you're radio hasn't been physically abused?
Perhaps you just have something against plastic? If that's the case, the ICOM mic is plastic also. The real problem with the ICOM mic is that silly hook and tab arangement they use for hanging it. Talk about cheap! Not only that, one of the first failures on my IC706MKII was the screw coming loose on the back of the mic and having that silly thing fall apart.
As for the FT-100 being a lemon, let's compare it to the IC-706 series. Icom is on the third in the series and as far as I'm concerned they still haven't fixed some of the things that were wrong with that radio. Would you use an original IC706? I think not. I happen to have the MKII, which I personally feel is a dangerous radio to run mobile. Not only does it have the dual menuing, which is harder to navigate, but the repeater offset arangement makes it way too easy to transmit on the wrong band. And that was their second try!
Sure, there's been some FT-100 failures and problems. Has Yaesu failed to fix them? No. Overall, Yaesu's support on the FT-100 has been pretty good. On the other hand I did have problems with Icom. When my 706 went belly-up I pulled the options to see if they were responsible. When Icom repaired the radio, they re-installed the options and tried to charge me for doing so, even though I made it clear on the letter I sent with the radio why I pulled them out. After talking to a manager for a while I told them to pull the options back out and not charge me, which they agreed to do. To their credit, they decided that was silly and left them in at no charge.
I think it's clear that both the FT-100 and the IC-706 have their strengths and weaknesses, but to call one a toy and the other not just isn't right. As I've said, I much prefer the FT-100 over the 706 and will continue to use the FT-100 as my primary mobile. If that bothers you, then I suggest you sell your FT-100 and go join some Icom mail list.

Topic: 4894 Message: 4895

The procedure for unsubscribing is to send a message to a 'special' address, not to the normal list itself. It must be sent FROM the address that you normally send email to the FT100 list.

From the FAQ:

Unsubscribing from the FT100 eGroups list

You can unsubscribe from the FT100 list by sending an email containing the message:

UNSUBSCRIBE

From the email address where you received the messages. The word UNSUBSCRIBE is all you need to have as the body of the message. There is no need to have a subject line.

Send it to:

FT100-unsubscribe@egroups.com

4896. Re: [FT100] Cat Control

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-25 12:21:03 UTC
From: Lee Devlin
Topic: 4888 Message: 4896

I think there may be some confusion about whether the FT100 is supported by CAT functions vs. having the ability to remotely store and retrieve the memories. They are two different issues. The FT100 actually has a lot of CAT support from various packages. On the other hand, there is no CAT command available to store and retrive memories so that would explain why that function is not supported.

From the FAQ:
CAT operation

The CAT functions require the use of accessory CT62 which is a custom cable that connects to the ACC pigtail and has a built-in level shifter. The CAT functions of the FT100 are supported in the following programs:

LogEQF
LOGic (via TRX-Manager)
LogWindow Version 3.07
DX4WIN
Logger
Shacklog
TRX-Manager
TR Log

The ability to upload and download memories from a PC is not supported. The program usually associated with this function for Yaesu radios, namely ADMS from RT systems, is not available for the FT100 and last time I talked with them, they have no plans to support it.

Again, from the FAQ:

Storing memories remotely

There are no programs currently available to store your memory settings remotely, an obvious oversight for a radio with more than 300 memories available. There was a rumor that RT systems was working on a version of ADMS software to provide this capability but they have confirmed that this is not true. They have no plans to support the FT100 with ADMS.

In order to store and retrieve memory locations, the ADMS software generally relies on a function known as 'cloning' which is a way to move settings from one radio to another. Although this function is common on Yaesu HT's, it does not appear to exist on the FT100.

Consider that the FT847, which DOES support cloning has been shipping for at least 3 years and it still does not have a commercially available program to store/retrieve/edit memory locations from a PC. There is a freeware program available, but its menus and documentation is written in French.

Unless there are some undocumented features in the FT100 firmware, it's unlikely that we will ever be able to upload/download the memory locations.

4897. Instability on 17-10m

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-25 11:39:03 UTC
From: Ignacy Misztal
Topic: 4897 Message: 4897

Instability on 17-10m seems to be caused by inadequate grounding at the filter board, as was discussed many times in this list. Instability does not accur with some antennas. To me, this is caused by two factors. First, a given antenna may have a perfect SWR on the operating frquency but could have an impedance close to 0 or infinity at a frequency where it is susceptible to oscillations. Second, it seems that some RF feedback occurs through the power cable, which enters the rig very close to some RF coils. Summarizing, rough edges in the FT-100 causes it to self-oscillate with some antennas and power supply combinations but not all of them. It the radio is close to oscillations but the oscillations do not yet occur, the audio may sounds distorted.

The radio has some grounding straps to the filter cable already installed. I added another one to help with instability with portable antennas. Both grounding straps snap to the body of the radio. I have found out that that connection is not very good and loosens with time, causing oscillations again. Thus, attaching the grounding strap with a screw would make a more permanent connection.

I operated FT-100 from a portable VK2 location for the last couple of weeks. The radio did well although I had a few complaints. First, on some bands there was RF feedback I think through the microphone. The 300 Hz filter was about 150 Hz off the main frequency and its attentuation is too big. Operating split with CW filter changes and NB is a nightmare because so many buttons need to be pushed but it works. Anyway, I could work anybody in the world if the competition was minimal.

73,
Ignacy, NO9E

k
Ignacy:
If the instability you describe is the problem that's fairly common with FT-100's, then it's not really an oscillation, but rather stray RF or HF rf getting back into the VHF/UHF antenna line, that's affecting some control circutry in the radio.
RF getting into the mic and power lines is a common problem with many/most HF mobiles. I've had the same problem with my 706. It is however separate from the above problem.

4899. ft-100 and SB-200

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-25 14:33:27 UTC
From: Will R
Topic: 4897 Message: 4899

I got my SB-200 fired up and everything works fine except the match between radio and amp (with amp on) on 10M and 15M is enough to turn on the SWR Icon.

I know this is an FT-100 list, and the amp is the problem, but maybe some of you may also use this amp, and have found a "fix" for the tuned input on the internet. Please send info or URL's!

Thanks in advance

Boy, you're really taking this personally. Do you sleep your FT-100 ?
From the tone of your message, it sounds like this egroup is supposed to be for those who only have good things to say about the FT-100. (i.e., so you can drool over pictures and details of your installations with each other ? :)
Maybe it's just me...I have no emotional attachment to any of my radios.

Re: "So, I take it you don't like the FT-100 ?"
I think after trying out the FT-100 that I prefer the look, feel and operation of the 706. I've owned an original IC-706, a TS-50, a DX-70 and now an FT-100. My comments are based on my own personal experience. Yes, they all have the strong points and weaknesses. However, after reading through many of the posts here on the egroup, it seems as though I'm not alone on the FT-100.

BTW, the reason that Icom is on their third version of the 706 has more to do with feature enhancements, not design flaw fixes as is in the FT-100. Sure, there were some 'bugs' that they did or didn't take care of along the way but they weren't really design flaws that affected the basic advertised performance of the radio.
From the original 706 to the 706mkII, key enhancements were addition of DSP (no provision for it in the original...the 706 came out on the cusp of DSP imlemenataion) and more power on 2 meters, and from the 706mkII to the 706mkIIG, the key enhancement was addition of 70 cm.
The difference between the FT-100 and FT-100D has more to do with a re-design of the boards for proper operation,
not because of the inclusion of options as standard equipment as Yaesu marketing would have you believe.

Oh and yes, I do hate plastic. If you live in a Northern climate area like I do, you'll understand why.
Plastic is more prone to breakage, espacially in cold weather, it wears quicker than metal, and depending on the grade, it deteriorates with exposure to uV.
I'd like to know how "...this plastic mounting on the FT-100 is more stable than the metal one on the 706.". ?
In cases of mechanical mounting and where weight is not a factor I would certainly chose metal for strength and durability.
With regard to the "cheap" Icom mic, I'd bet the Icom metal hanging bracket arrangement cost more to implement than the integrated molded plastic knobby on the Yaesu mic. I've had no problems with this arrangment. What I say is that the Icom mic 'feels' like it should for it's size whereas the Yaesu mic doesn't. Perhaps a piece of steel inside the mic to give it some wieght would give me a (false) feeling of quality :)

Just for the record, I have no personal allegience to, or affiliation with Icom, Kenwood, Alinco or any amateur radio manufacturer. Among other brands of radios, I also own a Yaesu FT-847 and a VX5R HT (note to gsellani@......I much prefer the metal case on the VX5R. Although it gets hot, it's comforting to know that the heat is being dissipated OUT of the radio.) I quite like my little VX5R and, although I have a few beefs about the 847, overall, I like it too.

After test driving the FT-100, I simply like the 706 better in this class of radio.

Hmmm, I have not had any feed back with the DTMF mic. Are you using a different mic?

As for the 300Hz filter, I do have it installed and I don't have a lot of attenuation in the pass band. You may have a bad filter, it seems like someone else had a bad filter a while back. my 300 Hz filter works Great.

hello all

I have only had my ft100 for about 2 weeks and I have not used it becouse I am rebuilding my shack but I like hearing what other peaple have to say about this radio thats why I joined this group and I must say that some peaple seem to take things very personally but my idea of this group is to learn both the good and bad things about the FT100 so if I have a problem I will have same ideas of what to do and if I dont I can ask other peaple. I like my radios just as much as some peaple like motobikes or cars so the idea of same one getting upset or taking things personally about what others think about the FT100 is a bit silly.

The FT100 is a great radio becouse of the size of it and all that it can do, thats why I bought it!

You Have got to be Kidding !!! I Have one of those VX-5?s Next to being water proof that Metal case is one of its great features !! It acts like one Big Heat sink. I would never trade it in for a Plastic HT

As far as the Tone Decode problem with the VX-5 You only have to be 10% Smarter then the Equipment that you are working with.. There is nothing wrong with the VX-5 CTCSS If the small delay bothers you. Then use some common sense and deactivate the Battery save Function or reduce its sleep time. And the CTCSS Decode time Delay will be negligible

I fortunately don't own the VX5, but rather played with some that others bought, which convinced me getting a FT50 was a good idea. I don't need heat sinked into my hand, thank you very much. The performance on 6 meters was pretty useless, and the bottom line was the out of band perforce was at best deaf. It doesn't work nearly as well on mil air as the FT50, which by the way makes the same waterproof claims. Even at getting the VX5's back from the factory for the bug fixes and doing all the settings tricks, the CTCSS is just garbage, no make that garbage squared. Yaesu should buy a Pro-92 and see how CTCSS is done. [A product that has other problems, but a new version is just coming out.]

The FT100 is much closer to a real product. From reading this list, with enough effort it can be made to do what it is supposed to do. The QA issues are the only outstanding issues, and so far nobody has said that Yaesu couldn't fix their FT100.

Not sure where you live, but way down south here in Northern Michigan
it's been known to get a bit chilly at times. Never had any problems with
plastic on radios in any vehicle as you mention. Also, since my radios are
mounted inside my truck, I generally don't have problems with deteriation
from UV. Where do you mount yours?
The reason the "plastic" mounting for the FT-100 is so stable is because
it contacts the perimeter of the front panel. I was playing with it while
I was driving to my office today and trying to see how it could be a less
than adequate mount. Just can't see it that way.

> I also own a Yaesu FT-847 and a VX5R...

That's funny, so do I. Agreed, I never did understand the arguement some
make about the VX5R getting hot. It's all a matter of size and heat
dissipation. Also, when it gets "chilly" down here in Michigan, we
sometimes like to warm our hands.

> After test driving the FT-100, I simply like the 706 better in this
> class of radio.

Espressing it that way, I can't argue with you. Calling it a toy I can
take issue with.

In my case, whenever there is Hi SWR-icon on 17-10m while the antenna is tuned to low SWR, the frequency meter detects oscillations around 13 MHz, as was mentioned in this group before. I believe that the power cable is part of the fedback loop for the oscillations.

The RF-feedback to the microphone is different, and it occurs on some but not all bands. In my case, it was strong on 40 and 30m SSB, where my portable long wire had probably the highest voltage near the radio. Putting the mike and its cables on the steel body of the FT-100 reduced the feedback considerably.

My 300 Hz filter must be faulty. It is very peaky.

I live in Ontario, Canada where winter temperatures commonly get into the double digits below zero. Living in Michigan, I'm surprised that you've never experienced the joys of having a brittle plastic tab break off something in the freezing cold. I've even had plastic break in warm weather where, if you twist something the wrong way, it breaks easily. How about the stiff-as-a-board mic cord when you jump into the car on a nice cold January morning ? I've seen mic cords crack
from people yanking on them while they're frozen. (Some older mic cords are made of rubber, newer ones are made of a vinyl or similar plastic).
Have you never seen what happens to some plastics after prolonged exposure to uV (sunlight) ? Plastics can crack and deteriorate into powder. I've seen plastic bezels on older radios get that yellowed look to them, especially noiceable on lighter coloured plastics. The discolouration is a sign of uV breakdown.
Not that any of this has happened specifically to Yaesu products, I'm just pointing out the drawbacks of using plastic vs metal. I don't think we need to beat the plastic vs. metal issue into the ground any further.

Keyword..."adequate". It might be 'good enough' for you but I still prefer the metal mount.

Yes, and to reiterate, I'd much rather have the heat coming out of the radio than being couped up and insulated inside radios with plastic cases. Heat is one of the biggest killers of electronic components.

Nonetheless, I've never had my VX5R cooking to the point where it was uncomfortable to hold.
Furthermore, a handy talkie by nature, is subjected to the possibility of being banged around and dropped...I feel better knowing that the survivability of the case on the VX5R is much greater being made of metal rather than plastic !!!

Yes, perhaps labelling the FT-100 as a"toy" was a little too harsh. It boils down to a matter of personal preference.
What isn't acceptable to me may just be fine for others.

So, what's up with the possibility of reading/writing to the memory channels in the FT-100 ?
I agree with k0lee@.....for a radio with more than 300 memories, the lack of a cloning feature is an obvious oversight. Was it completely overlooked in the firmware ? Since the hardware to talk to the micro is all there (i.e., other CAT features are possible), it should be as simple as a firmware update. Is the micro FLASH based and in-circuit programmable ? If not, can the micro in the FT-100 be replaced like it was in the FT-847 ?
I wonder if Yaesu would be willing
to give free microcontroller upgrades to those who request it just like they did with owners of early 847's ?

RE: Plastic vs. Metal

I'd like to point out that several years ago, Motorola
came out with their little hand held with a plastic
case.

The salesmen would throw them around to show just how
solid they were. I've seen then get run over by cars
and fork lifts.

Very seldom any damage.

Now if the metal cased GE's got dropped, the cases got
bent and often broke. (I have even seen parts fall out
of some radios when dropped!)

So I for one kinda like the plastic.

But it never gets too cold in South Idaho. If it gets
to -20F that's unusual. I have no idea what it might
be like at -50F or more!

Let me also add that I've seen circuit boards with broken
traces after being out in the cold.

I have often wondered if we are not really asking for
all kinds of trouble when we leave our rigs out in the
vehicles on those cold winter nights!

In my discussions with the guys at the Yaesu booth at Dayton I was told that the reason it starts outputting signal at wierd frequencies is that it's messing up data that controlls PLL's, mixing, whatever. So, while it appears to be oscillating at 13 MHz, it may not be like it's a matter of positive feedback causing stages to go into oscillation, but more that it's no longer transmitting on the correct frequency. This behavior would be consistant with the effects I saw on my tuner before the radio was updated by Yaesu.

Have you tried clamping a ferrite choke on the mic and power cables? That will usually stop that kind of garbage and did in fact with the 706 install in my wife's vehicle. In an extreme case, you may have to put a more agressive filter on those lines.

Oh yea, I've had on numerous occasions had to lean over to talk on the
mic because the cord wouldn't streatch when cold in the morning. That's
why I try to mount the mic line as close to the operating position as
possible.
The UV issuse is why it's never a good idea to use the cheap white
tie-wraps outside. However, in 30 years+ of mobiling, I've never seen a
plastic rig have UV problems. Perhaps I don't keep then long enough.

OK, but I've worked with both and prefer the plastic one for the FT-100
over the metal clip for the 706. Again, a personal preferance.

If you ever opened up a radio with a plastic case, you will find a heat sink for the PA. I think Yaesu skimped on the heat sink on the VX5 because the case was metal. The figure the theta JA (junction to ambient heat resistance) is lower, but neglected the fact that the user needs to hold the thing. Cheap yes, but not very good.

It is the junction temperature of the semiconductor that you want to keep cool, preferably under 100 deg Celsius. How you do it is a matter of engineering. Just because the case is getting hot does not mean the junction is cool. By your argument, the Pentium II is no good because the case is plastic. See my point. You engineer a product for performance, look, and ease of operation. The VX5 fails in two of these categories. I think Yaesu gave up on the product. The FT100 on the other hand is being refined. You note the incidence of failed units being reported here is much less than 6 months ago.

hmmm. I have a FT-530 with a metal case. The finals are bolted directly to the case. I have used it for Cross band repeating for hours on end. Due to the heat sink being very efficient, the case will get warn but the finals stay relatively cool. I have an alinco DJ-160 and it has a metal case, but it is not efficient in dissipating the heat.

I believe that a metal case will get the heat out better than plastic, but it must be designed properly. Also too much heat sink grease will not allow the heat to be dissipated.

I am quite new to the FT100 series (only had mine for a week) and I really appreciate all of the help I have received from the guys and the list. But, if I may, could I suggest that when discussing the Ft100 series radios, you tell us if it is the FT100, the FT100D or and updated FT100. I am trying to understand the various problems and quirks of this radio, and I sometimes do not know if it affects my radio FT100D or not. Thanks alot, and keep the info coming. By the way, I will start running mobile RTTY soon with the FT100D from my motorhome for all of you county hunters out there. Any thoughts on the FT in this mode? Thanks again, Jeff WB8QYT

These oscillations also occur when the antenna jack is and the radio is
put on transmit with no signal. One can short one of the filter cables
with a screwdriver. With the cable shorted, there are no oscillations
and no Hi SWR icon. With the short removed, the oscillations resume.

One large ferrite bead on the power clamp improves the TX signal but
does not quite eliminate the oscillations. Perhaps one clamp is not
enough, and the power cable may be just one of multiple paths for the RF
feedback. Perhaps more than one bead is needed. Beads on the microphone
did not help. Probably the RF feedback occurs within the microphone.

Now I'm confused:
Plastic is no good on the FT-100, but the VX5 is berated because it's
not plastic. Funny, isn't it?
Yes, the PA needs a heat sink. The efficiency of any heat sink depends
on the temperature differential between the heat sink and the surrounding
air temperature. If the heat sink is internal to the radio, the air inside
the radio gets warm and reduces the heat dissipating efficiency of the
heat sink. No way around that without ventilating the heat outside and
I've yet to see an HT with a fan!
If the transmit duty cycle is minimal, heat inside the radio will have a
chance to dissipate. If the duty cycle is significant, it won't.
Personally, I use my radio for more than kerchunking repeaters so I
appreciate the VX5's ability to dissipate heat faster.
I think what's catching people off guard on this is the size of the
radio. The smaller the radio, the more you're going to feel the heat in
your hand. Since there haven't been too may radios the size of the VX5
that can run 5 watts, most people are surprised by this effect.
So, where would you like the heat to go? Until someone builds a radio
that uses the antenna as the heat sink, they'll have to dissiplate the
head out the case. The smaller the radio, the more that case is in contact
with your hand. It's not rocket science.
Similarly, the smaller 100W mobiles get, the more they need to work at
getting rid of the heat. I've heard people complain about the fans on the
FT-100 making too much noise. Perhaps they also are used to larger radios
that don't need to move as much air to keep cool.

Topic: 4915 Message: 4921

It is a potentiometer located next to the speaker jack connection on the board. Take a very small flat head screw driver and rotate while listening to the side tone. Tone volume will increase until max-if you pass this point sidetone volume will be back at "low". Go slowly...you can go back and forth to find the highest volume.

gud luck

If you haven't already, I'd suggest you have Yaesu install the fixes for
this or try one of the fixes suggested by others to supress the stray RF
inside the radio.

If this were so, then the ATAS-100 would eventually find the right
length to oscillate at 13 MHz. But it does not.

John:
Only if the radio stays at that frequency. Also, I suppose it's possible
that the problems affect the radio's ability to properly report SWR.

I won't continue to argue that metal is more durable than plastic but I'd put my trust in a metal cased HT to survive years of use and abuse over one in a plastic case.

> I have often wondered if we are not really asking for
> all kinds of trouble when we leave our rigs out in the
> vehicles on those cold winter nights!
> 73, Ron

I agree.
I work in avionics design ...we test our products from -40 to +60 deg. C. All of the components that go into our products must be functional at those temperatures. I don't have spec sheets on any amateur equipment handy but I'm sure they aren't rated to those extremes. Although I do it, I'm not comfortable using my amateur gear in freezing temps. I often wonder if components like electrolytic caps might freeze and endure permanent damage. I'm not up on the chemistry of the
electrolyte that they use but I worry about components that may contain liquids. LCD display sure are slow to change when its that cold !

>You know, these 'problems' I've experienced with all makes of radios, amateur

> >and commercial. Let's get off this subject and on to something productive. :)

Yes, and as the discussion progessed, I made a point of stating that the 'problems' were not necessarily a Yaesu thing, that I was just pointing out why I preferred metal over plastic.
Okay...let's get onto something more productive...

I want to talk about the subject of reading and writing to the memory channels in the FT-100.
I'll just quote this part of my last message since those who quoted my last, interestingly excluded it....
"Since the hardware to talk to the micro is all there (i.e., other CAT features are possible), it should be as simple as a firmware update. Is the micro FLASH based and in-circuit programmable ? If not, can the micro in the FT-100 be replaced like it was in the FT-847 ? I wonder if Yaesu would be willing to give free microcontroller upgrades to those who request it just like they did with owners of early 847's ?"

I never said plastic was bad.

The VX5 and modern ham radios have more efficient PAs, which means they should generate less heat in the first place.

Again, you need to compare the situations of having no heatsink and a metal case to having a plastic case with a good internal heat sink. Heat sinking is a matter of mass, surface area, and materials. You simply can not make blanket statements like metal is better than plastic, because the plastic is really a chuck of metal plus plastic.

Another problem of the VX5 is there is no alkaline pack option. I like to have a HT for emergency use, so the alkaline option is a must.

Most hams have figured out that 5W hand held is not nearly as good as 2W plus a good antenna. If you are really using HTs in poor signal areas, set an Anli 2 in 1 and a BNC to SMA converter. The antenna gain gives you improved reception and of course transmission, while running 5 watts only give you a stronger signal.

I've noticed that the newer Yaesu metal case radios are a thicker die cast style, while the VX5 is kind of tinny. You will recall the first generation VX5's had an acoustic feedback problem, probably due to the very light case.

To keep this relevant to the FT100, I've noticed that only the FT100D is listed on the Yaesu web page. I though they might market both versions, but it looks like they D version will be the only model.

Why do I feel I've been transported into a presidential debate where
a person can say whatever they want simply because it sounds good to them
on the hopes that nobody will notice that it's not true. There's nothing
tinny about the VX5. Anyone who's held one in their hand or dropped one on
cement can tell you that. Mechanically, it's a very solid radio and the
mass of the heat sink/case is more significant than any internal heat sink
I've ever seen in a handheld.

> You will recall the first generation
> VX5's had an acoustic feedback problem, probably due to the very light case.

Again, let's get out the truth. The acustic feedback problem on some
VX5's (we have two and neither has this problem) was an electrical
connection issue and has nothing to do with the case, which is not "very
light".

> To keep this relevant to the FT100, I've noticed that only the FT100D is

Hmmh, if it is acoustic feedback, one would think it the physics behind the problem is acoustical in nature. If the feedback was electric, one would think the feedback would be electric in nature. Perhaps if should of been called "electrical feedback". All I know is it was one of the factory fixes.

Just like GWBush, I'm not going to debate this anymore. And no fair asking what drugs I took 25 years ago...

The word OPEN slipped out o fthe text, which is repetaed with the correction below.

These oscillations also occur when the antenna jack is OPEN and the radio is
put on transmit with no signal. One can short one of the filter cables with a screwdriver. With the cable shorted, there are no oscillations and no Hi SWR icon. With the short removed, the oscillations resume.

The oscillations were detected with a frequency counter. Shorting is a procedure recommended by this group. The above experiment was a proof that oscillations have nothing to do with the synthesizer, despite Yaesu claims, but only with the power amplifier.

My radio went to Yaesu in May. It came with many modification, mostly I think ferrites on cables, but no shorting straps. The oscillations remained.

Please let me recap. Before the modifications, there were no oscillations with good stationary antennas or a mobile antenna with 3 large magnets. There were oscillations with a mobile antenna with 1 magnet, with a magnetic loop antenna, or with portable antennas. This indicated RF feedback in FT-100 through some cables becaus ethe last antennas generated large RF near the radio. After strapping one of the filter cables to the bdy of the radio, the oscillations stopped with all the antennas.

Do you know what cable that is? Is that before or after the power
amplifier and is it before or after the reflected power sensing?

> The oscillations were detected with a frequency counter. Shorting is a

I think answering the previous question may help us to sort this out.
One additional question however. How stable are the oscillations? If it's
the power amplifier taking off (which I really have trouble accepting)
then the oscillations won't be stable. Also, do you have a spectrum
analyzer you can put on there instead of the frequency counter? (Often
there's more going on than the counter can tell you.)

No heatsink and a metal case ? The chassis (case) is the heatsink on the VX5R, and a good one at that.
Did I get lucky with my VX5R ? I'm quite happy with it.

>To keep this relevant to the FT100, I've noticed that only the FT100D is

> listed on the Yaesu web page. I though they might market both versions, but
> it looks like they D version will be the only model._

Yaesu probably wants to forget that the original FT-100 ever existed...it was a nightmare for them.
The 'D' is what the original was meant to be in the first place. The included options (and better speaker) gimme is a marketing game to cover up the fact that the D is a major revamp. An original FT-100 with the same options installed IS NOT an FT-100D. Not to discredit Yaesu for wanting to improve their product but let's face the facts.

Since I'm hearing how wonderful Yaesu is at taking care of their customers and resolving problems with their products...
Do you think Yaesu will give free microcontroller upgrades to those of us who want to have CAT memory manipulation in our FT-100 ? (They did for the FT-847.)

Hugh.

reply to Gary

Please post the information on VX5 site of all those that you know that aren't using them and they will sell fast.

YAESUVX5@egroups.com

I disagree with your statement about the FT-100 vs. FT100D as that was not the wording used by a Yaesu Rep. at Dayton. What about the addition of the filters, CTCSS Decode, and TXCO-8?

As for all the talk here about cold weather hurting your radio. Ask yourself the other extreme, heat, heat, heat, how many of the radio failures have come from overheating or turning the radio off while hot from finishing a transmission and turning it off immediately. Why do you think they put fans on the radio and heat sensors to cycle the fan?

Yes, I own a FT-100 and it is my vehicle in the desert and it has seen over 165 degrees F in the cab and been down to freezing temps in the Rockies. It has never had to be sent back and has operated very well for 15 months in a 4 X4 with more rough rides than one a car will ever get.

Bob KA6LSL

P.S. My VX-5 internal temperature has been seen at 45 degree C. Yes, the case is hot to touch but so is the steering wheel when you get into a hot vehicle.

Jason, part 2,

The coax between the ATAS100 antenna and FT100 or FT847 radio, conducts not only the RF energy, but also delivers voltage to run the electric motor. As you QSY bands and hit the 'Tune' button, the rig will transmit a 10 watt carrier, read the SWR condition and try to minimize the SWR by adjusting the length of the antenna coil. You don't have to stop the car to change band coils!!!

4938. Any luck with a mag-mount for ATAS 100?

Yahoo group: FT100 (1998 — 2000)

Hello,

I read somewhere that the manual for the ATAS 100 says NOT to use a trunk lid mount for the antenna... Is this true? Seems most operators are using the Diamond K-400 trunk lid mount? Any one have a good pic for a sturdy mag-mount withe the SO-239 connector?

Thanks!

Hi,

I'm using the Comet trunk lip mount on the left side of the lid. I also ran 2 braided bond wires from the mount to the lid, and 2 from the lid to the body (1999 Olds Intrigue). Have no tuning problems, even out of band. The braided bonding is the shield from RG-8 coax.

Jason, do your self a big favor!!!
Stay away from mag mounts, or short-cut antenna mounts. You mean, after you investested a grand for a radio and $285 for an antenna you want to screw it up with a sh-tty mount???

K400 or K600 with the trunk lid clean down to the metal under the mounting screws should work.. Of course UNLESS you have a new PLASTIC car!!! :-)

Good luck & 73s

Jason,
The manual says that mag mounts should be avoided, not trunk lid mounts.
Pg 64, under Grounding, for the reasons. The K-400 seems to be the most
popular mount for the Atas-100.

"This list" can continue to convince yourselves that the D is simply a dressed up original 100 but my sources at the local radio store tell me that the D is indeed completely revamped...with newly designed and enhanced boards. Don't take my word for it...look into it yourself !
When the stock of original 100's is depleted, you'll only be able to buy the D...when they's gone, they's gone !

So, what about that microcontroller upgrade Yaesu ?
Will you offer a replacement micro that will allow CAT memory manipulation ? You did it for the 847 !!!

From: John Walker
Topic: 4943 Message: 4943

The manual here doesn't mention that at all, it does mention not to use a mag mount (single). You can use one of those quad or tri mounts ok, just run braid to a ground point from the rail of the antenna base. I've used the trunk lid mount on two cars and on rentals when I am away on business, radio & antenna have worked great.

The FT-100D is a FT-100 with the added options (larger speaker, CTCSS decode, 500Hz CW filter, and TCXO-8) It comes complete with oscilation
problems the FT-100 has been famous for to boot. Yaesu Rep at a show even told me that the FT-100D is a FT-100 with addded options, thats all. Nothing revamped here, and I cant be convinced otherwise.

As for the FT-847, Yaesu added bidirectional data so that the radio could both be controlled and read, but the cloning feature was already
there and was used by programmers to do computer memory manipulation.

I have several Yaesu radios and it suprises me that each one is so different in the way they work, one has cloning another doesnt, one has
direct micorophone keypad frequency entry and another doesn't and they
all require a new way to navigate around. I am suprised to find the Ft-
100/D doesnt have memory management/cloning via a computer, but then thats Yaesu in my opinion.

4945. Adjusting frequency clock

Yahoo group: FT100 (1998 — 2000)
Date: 2000-09-30 20:51:28 UTC
From: Lee Devlin
Topic: 4945 Message: 4945

I got a question via email from an FT100 owner looking to adjust the master clock on his FT100 which he noticed is about 210 Hz off frequency. Does anyone know how to do this? There is a method on the last page of the manual on how to do it if you have the high stability oscillator accessory by using a pot on that board. However, I don't have a service manual, which is where I would suspect a topic like this would be covered for regular FT100s, i.e., the ones without the high stability oscillator accessory.

Jeff,
You can get both ends of the power connectors from Yaesu in Cypress
ca. for about $4 each.

4950. ATAS-100 Purchase ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-01 16:03:25 UTC
From: James Pope
Topic: 4950 Message: 4950

I have owned a FT-100 now for about six months, and have been using a hustler mast with four resonators on it for the antenna system.

I am thinking about buying the ATAS-100 for installation on my 1986 Dodge Ram Truck. I have noticed a few e-mails concerning difficulty with this antenna.

Could some of you with expierence with this setup please give me your thought and advice on this antenna. Good points, bad points, what to make sure is done during the istallation to avoid problems.

I plan to mount the antenna on the hood as I have an metal camper on back and I am afriad of reflection, been there before. Also I have noticed that the specs say it will not tune obn 17 meters but I have read someones post that says it does, does anyone know.

Also if I run only the ATAS-100 and still want to operate on 2 meters will I need a duplexer or not?

Thanks in advance
James - KC0DND

From: Lee Devlin
Topic: 4950 Message: 4951

I have the ATAS100 installed on my Dodge Durango on the hood and it works fine. The only problem is that the hood lip is somewhat flexible and I can see it move around in the wind, particularly when I'm driving at highway speeds. I suppose it does this to some extent when mounted on the truck lip, but you know what they say, out of sight, out of mind.
You can see it at:
http://members.home.net/k0lee/durango.html

I have no difficulty tuning on 17M. There is just no guarantee it will work on the WARC bands. I've worked many European and JA stations no problem with this mobile setup, mostly on 10 and 12M. If you want to operate on 2M or 70cm, you'll need to either use a duplexer or a separate dual band antenna for those bands. I've done it both ways and haven't noticed that one way is significantly better than the other.

4952. strange icon!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-01 18:33:18 UTC
From: J
Topic: 4952 Message: 4952

Hello all,

Yesterday I installed a 80M hamstick on the pickup for use with the FT100. SWR reads about a 1.5 to one on the external meter that I tested the installation with, and the internal meter on the FT100 showed only displayed a few "bars" when I transmitted. However, the icon that was displayed was very strange!

I am sure by know we have all seen the hi swr icon, and the 'off' icon (The box with the sprite above it) when one (by mistake) tries to transmit out of band.

However, has anyone seen an OFF icon that looks similar to the ON icon when you first start up the rig? The icons look very similar except 'on' is replaced with OFF.
It is not on the icon list here:
http://www.egroups.com/files/FT100/Ft100icn.jpg

I did have the ATAS menu setting set to OFF.
When I was transmitting even with this icon showing, and others were receiving me.
If I tuned past the limitations of the hamstick but still stayed in the band, the OFF icon was replaced with the standard HI-SWR icon..

Very strange!
Has anyone seen anything like this?

Thanks -- Jay N1RWY

I added a coil of coax (about 30 feet) under my seat to the basic magmount coax. This has solved my tuning problems on both 10 and 40 meters and everything in between. The magmount has a ground to the pickup box.

I have a separate Larsen 2/70 for the VHF/UHF side and like being able to switch from HF to the repeaters and back without retuning the 100.

I am happy to report that the problem has been fixed with yet another clamp-on ferrite core. This one was placed on the VHF pigtail (I have not needed one there before), and the FT100 now plays the way it should with the hamstick.

Very strange!

4955. 100-*D* filter installation

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-02 13:05:49 UTC
From: Brian Smithson
Topic: 4931 Message: 4955

Wow, that was hairy!

I installed an XF-117A filter in my -100D this weekend and it isn't exactly as easy as the manual would have you think. Maybe for the -100 (minus D)...

The layout inside the rig is pretty much as described, but there are a lot of little 'extras' too:

1. Be sure to make note on the figure in the manual the color coding of the coax - they mention it in the text but it is not in the diagram!

2. There is some tape 'binding' a couple of the cables on the left that also holds a cap in place - handle it carefully!

3. There is a small circuit board with sticky stuff on the back that seems to want to stick somewhere on the top of the board. When you're putting it back, try to steer clear of where the speaker will go when the cover in reinstalled!

4. Removing the ribbon cables can be tricky - it is a scheme I haven't seen before - you have to lift up on the plastic connector to free the ribbon. Putting them back can be even more fun - you have to hold the plastic connector up while you insert the ribbon then push _both_ down!

5. There is a little green wire running from the middle of the board you need to life up to the back of the rig. On mine, this absolutely prevented me from 'folding the board forward' to solder the filter. I ended up cutting the wire and then splicing it back together afterward!

6. Pay attention to the screws the manual tells you to remove - I got carried away and removed the screws holding the speaker in place too. Not a big deal but a little dexterity is required to put the brackets back...

Anyway, all is well and it works nicely. Just wanted to pass along the notes in case anyone tries it themselves!

73!

If you know what the signal levels are for the input and output, the actual connector is the same connector that Apple Computer used to use for their serial connector - a mini din 8. I found them at Atlantic Electronics in Clearwater, FL.

4961. A/B, keyer, & split

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-03 13:34:42 UTC
From: Brian Smithson
Topic: 4961 Message: 4961

Hi all!

I've been noodling more with CW on my 100-D and I came across an annoying 'ergonomic' problem last night while trying to work 8Q7AB split on 20 CW. I'm wondering if others have a suggestion...

I programmed my call into the keyer, so hitting 'PLY' when 'func menu 8' is displayed sends my call. I'm working split so I want to listen to the DX on A and xmit on B. The DX comes back to someone else (that's the fun of the pileup, right?) so I want to jump to B and find the lucky ham so I can be ready when they finish. Trouble is, I have to tab thru 2 menus so A/B is available, press it, tune to the winner, hit A/B again to go back to A, then press FUNC 7 more times to get back to the keyer menu so I can hit PLY to try it all again!

Is there any way to make this easier? I looked into assigning either A/B or PLY to one of the mic buttons, but no go. Am I missing something? It wasn't nearly as much fun as it normally is! :) I guess I can just send me call with the paddle but what's the point of the memory keyer?

-Brian n8wrl

Gordon is correct. However, there is a sort of a workaround if you have the time.
Save your current A/B split frequencies and mode into memory xxx. Copy the B freq (your DX target's listening freq) into memory xxx+1. Use the memory up down on the mic or the panel to switch back and forth. Leave your function key set on play.

That sounds like it might work out, except that I usually
want to tune VFO-B around a little to locate the next spot
where I'll transmit. I'm not sure that switching between
the two memory spots will let me do that...

why don't you use the RIT button. It works for me, when I do split ops.

You can use the Memory Tuning feature, by pushing the "SELECT" knob when
you are in the "B" memory channel. A "M T" will show where the "MEM"
shows on thie display. When in this mode you can tune with your memory
channel as the starting point.

Ah, now that's an idea! Let's see, RIT would mean my VFO
would be where I want to xmit and then RIT would get me
to the DX frequency. I would have to adjust both the VFO
and the RIT to change my xmit freq and still hear the
DX, but it would be a lot better than the menu shuffle!
Too bad there's no XIT...

Thanks for the tip - I'll try that!

4968. FT-100D major upgrades ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-03 19:26:55 UTC
From: fred klien
Topic: 4968 Message: 4968

I have heard 90 % of the people (including Yaesu) saying the FT-100D simply had the filters etc added. The only way to tell is for two guys who have both the Ft-100 and Ft-100D to open up the radio and compare the insides. Also, the FT-100 (original) must have all the mods installed. This is the only way for sure to see if there are any changes.
73's FRED

There could be firmware differences, component changes, etc. Having both schematics and a bill of materials would be the best way to tell if they are different.

Yes, Several people have over looked that little button. It will work a lot
easier than A/B VFO.

Let Me know how it works for you.

4971. FT-100 micro upgrade

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-03 23:27:20 UTC
From: Duffer
Topic: 4971 Message: 4971

If the Yaesu rep told you that the FT-100 is a scaled down FT-1000, would you believe that too ?
I take it from a reputable technical authority at a local ham dealer that the FT-100D *IS NOT* an FT-100 with the additional options and improved speaker. The boards are DIFFERENT...they've been redesigned to overcome some of the problems in the original FT-100. Sure they may not have licked all of the problems like the oscillations...that may have been something that cannot be cured by board fixes...i.e., the close proximity of the PLL/DDS frequency control to the PA, and the inherent design of the chassis which did not change. I have no inclination to "convince" you if you choose to stick your head in the sand !

I'm aware of the CAT upgrade situation on the FT-847..I own one.
What I'm pointing out is that a micro upgrade (firmware in ROM) could take care of the lack of cloning feature in the FT-100,
in a similar free upgrade program to what Yaesu did with the 847. Perhaps it was the QST review article (Aug.98) which spawned Yaesu to actually act on offering the free upgrade to early FT-847 owners. I know that I would enjoy my FT-100 more if it could do cloning and I'm sure programs would start to surface to allow memory management.

I concur with your surprise that every Yaesu radio has different features and inconsistent user interfaces.
It's as though different design teams work independantly on different radios and the right hand doesn't talk to the left.

Hugh: What you are saying regarding the "redesign" is actually more hearsay than the information coming from the Yaesu rep. Just because YOU place more credence in your "reputable technical authority" friend doesn't mean the rest of us necessarily believe it.
Offer some hard evidence or give it up already, this bickering over what you don't know for sure is getting real old. Frankly, I believe what the MANUFACTURERS rep says long before some jamoke working the backroom of your local store.

I have a 100D. I do not repeat do not believe there is a major redesign. I
am willing to take digital pictures of my 100D, but I would like to see your
pictures of your 100 before I send you the pictures, just to make sure you
don't modify the pictures!

All the pics of the 100 I have seen on the mod files are almost identical to
my 100D, with very very little differences.

From: mountainranch@hotmail.com
Topic: 4971 Message: 4974

I wish the FT-100D was revamped and fixed up, but I just got one and had to turn around and send it right to Yaesu and there it is now. It is in for the ocillation problems(which I consider a MAJOR problem), which to me, doesnt say a whole lot a about Yaesu's quality. Second the
power output is 10-20% less than advertised on HF and third, why is the
CW ID still spitting out U's for W's, mine is and I hope Yaesu fixes them all while they have it, well they better anyways. If they fixed any problems, I sure would like to know what it was they fixed.

Now if they have a firmware upgrade for cloning and memory management,
I hope they throw that in while it is there too, I sure would vote for
that. It seems like an oversight. If you have some ideas on how to get
Yaesu to implement that I would be interested. I dont mean to get anyones feathers ruffled, but from my experience, the Ft-100 is......

Back to sticking my head in the sand now:-)

Wow, your 100D only is putting out 80 to 90 watts? Was that into a dummy load?

I guess I am lucky, mine does 103 FM, 108 pep on HF. It does 95 fm and 105 pep 6 meters.

From: The Simpsons
Topic: 4978 Message: 4978

Just a thought re the power output of this or any radio. Before you worry about the power output being maybe 10% low, you should check the specifications of your power meter. Even good quality units are rated to 10% of FSD. If you are using a 100watt meter, then a reading of 90 to 110 watts when the power out is actually 100 watts will be acceptable. At 50 watts output, your reading could be between 40 and 60 watts and still be within the accuracy of your power meter.
Using a 200 watt full scale meter, then an actual output of 100 watts could read anywhere between 80 and 120 watts!
Also, check the voltage at the radio when checking the power out. 20 amps or more requires a very good power supply and good quality wiring to maintain the specified voltage at the radio when generating this amount of power.
Maybe I should check the output of my radio. Perhaps ignorance is bliss, as I am very happy with my FT100's performance! Remember that reducing the power out from 100 to 50 watts is only half an S point.

From: Erwin K6RCX
Topic: 4971 Message: 4981

Hi all, If the FT 100D is indeed a new designed set of boards, to fix some set of problems i'm really disapointed with the Yaesu design staff. The oscillation problem that has shown up in so many new AND old radios appears to have a rather simple set of fixes. Better grounds. If the "D" did not include this simple fix - what the heck did they fix!!! It looks they just did the additions they claim.

The "upgraded micro" idea that is floating these days sure has my support. Why should a radio with 300+ channels NOT have the ability to load memory from a PC. The simpler, cheaper HT's all have it. Yaesu are you out there???

Erwin K6RCX

4983. Power Lead leakage

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-04 17:32:40 UTC
From: Erwin K6RCX
Topic: 4983 Message: 4983

Has any one else noticed that there appears to be a fair ammount of RF leakage on the power lead(not the coax leads) at 440? Ever since the 10-12M HF oscilation problems I have left my RF sniffer sitting near the rear of the radio when it's in the shack. The HF problems are now all gone, but???

After reading the post about the filter instalation in a "D" it sounded about the same as the original. Wires and coax going over the main board that were "add-on's", coax that needed to be re-adusted etc. Not really the best layout to avoid stray coupling.

not complaining, I really like what the radio does, but Yaesu if you really are going to re-design boards etc someday ......

4984. FT-100 micro upgrade

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-04 19:19:28 UTC
From: Duffer
Topic: 4971 Message: 4984

Okay guys...Fair enough, I will look into whether or not there are schematic and BOM differences between the
FT-100 and 100D. True, I'm only going by what I was told by my buddy (jamoke :) at our local radio store but one must wonder why he would even mention this if it wasn't so ? You may want to check with your local store but
they tell me when the stock of original 100's is depleted, you will only be able to get the 100D. I wonder why if the FT-100D is simply a 100 with the options installed (and better speaker) ? Strictly marketing ? Is this a load of bunk too ?

Tom says "All the pics of the 100 I have seen on the mod files are almost identical to
my 100D, with very very little differences."

"...with very little differences."...Perhaps. When I say they've been redesigned, I don't necessarily mean from the ground up.
As subtle as the changes may be visibly, FT-100 and 100D boards are apparently different. I don't imply that the changes are 'major', just different enough that Yaesu is using the distinction of model numbers to identify which radios have what boards.

Re: How to get Yaesu to implement a micro upgrade...
Short of providing a list of names and callsigns of FT-100 owners who would be interested in a potential micro upgrade program to include the cloning feature, I don't have any other ideas which would get Yeasu to act on it. I certainly don't have the clout of a major amateur radio magazine. I'm here on the egroup trying to arouse some interest in it but there doesn't seem to be many bites.

Well, I recently installed the 6KHz xtal in my 100D
and compared the pictures in the eGroups library to
what I saw when mine was open and it looked a little
different:

There was a 'loose' board (CTCSS?) 'stuck' to
the main board on tip.
There was a little green wire going from the
main board to the rear of the radio.
There was more of the shield-ground straps I've
heard people mention as earlier fixes.

So just from that cursory examination things do look
a little different.

Yes the CTCSS is a little board that goes near the filters with
double sided tape.

> There was a little green wire going from the
> main board to the rear of the radio.

FT100 also had the green wire across the board
The lead dress and extra soldered in wires makes it more "more fun"
to lift the board and put the filters in

> There was more of the shield-ground straps I've
> heard people mention as earlier fixes.

NOW - if the factory would only STOP USING that %&%*% copper tape
with the conductive adhesive for grounds, we could stop wondering how
well the grounds are going to age. Past experience has shown it's not
good!

4989. Upgrade to FT00E+

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-06 17:49:06 UTC
From: Dan Baker
Topic: 4989 Message: 4989

I like my FT100, it works great. I sent it in for repair work twice. They did
a fine job and I had it back in under two weeks from when it left my door. (Both times)
Lets see, I have had mine since last December and use it 12 hours a day.

I will buy another one but the upgrades will have to go like this for me to do so. (Are you listening Yaesu?)
Here is what I would like to see the FT100E include.

1. A noise blanker that works good on 6 FM (the current one is not operative on FM and is a real problem in some GMC's)
2. A better audio amp. This one is poor or weak in the fm mode on 2 and 440
3.Computer programmable, 300 memory channels and you cant program it with the computer. What?
4. Direct frequency entry from the keypad. Huh? what happened here?
5. A synchronous AM detector for SWL
6. And last but not least. the addition of the 220 band and the ability to assign bands to one of three antenna ports.

Those are the essentials of what it would take for me to upgrade to the next version. Next is what would be nice but I can live without.

1. Back lighted buttons.
2. Alpha numeric display. (For memory channels)
3 A display with black digits that you can select colors.(blue,green,amber)
4 1.2 Ghz band
5. It would be OK with me to make a bigger version with
a built in tuner.
6. Move the mic jack to the outside of the radio.
7.The DSP notch filter should be better.

Well (a deep subject I know) there you go, that is what it would take.

Best Regards, Dan KM6CQ

4990. Ant1/Ant2 Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-06 18:17:22 UTC
From: bhawkins@idirect.com
Topic: 4990 Message: 4990

I have taken my 1 week old FT100D in for service because of a peculiar problem with the two antenna connections.

I have had a triband (6m/2m/440) connected to antenna 1 for use with 6 meter FM. I found that while it was connected, and while there was no antenna connected to antenna 2 (VHF/UHF), I could send and receive on 2 meters. The received signal strength is down about 6 S units from where the same antenna receives on 2 meters while connected to antenna 2. Transmitted signal is down as well. The antenna being used (Comet SB14) has low SWR when checked on all three bands.

Had I been using a duplexer, I would never have noted the problem. However, it would appear that there is very low isolation between the two antenna outputs (20-30 dB).

I was wondering if anyone else can check their radio to see if this problem is peculiar to my FT100D, or is a general problem with the unit. I won't hear from the service people for about a week probably.

Cheers,

Bob

Mr. Hawkins,

I am glad you have a (1) triband mobile antenna. You should very strongly consider a duplexer connected to the 2 mtr/440 pigtail , and 6mtrs through the 6mtr/HF pigtail. I am really surprised that you didn't smoke the 2 mtr/440 finals keying into a "no vhf/uhf antenna connected" arrangement. That is not good for your warranty or your ft-100. I am really surprised that you made contact on 2 mtrs with out a 2 mtr antenna being connected. OUCH!!!

Perhaps the radio would work better if "U" Read the installation instructions in the front part of the manual.

Good luck, :-)

Sure,

Just put on a longer whip. You'll need to tune for 7 MHz first (extend the coil all the way), then put the radio into the non-ATAS mode, change the whip, then you've got it. The bandwidth is real narrow, and tuning isn't automatic, but it works in a pinch.

This could be why a lot of us are having spurious RF oscillation.
Shielding and cable routing could be right on the brink of failure.

Thanks for sharing your findings with us!

Topic: 4990 Message: 4994

Bob,
You have run into an interesting possiblity. Some of the posts in the past have questioned if RF leakage into the vhf/uhf port may be causing oscilation problems. For what it's worth my radio had the 10-12 M oscilation problem and the vhf port was not part of the problem. It just oscillated with any antenna on HF. It went in for the ground fix and now works GREAT.
I did a quick measurement on my radio with a signal source and attenuator in the center of 2M. I got about 37 db differance between the 2 ports.

Erwin K6RCX

PS - it a shame it's your 6M element is part of the 2/440 ant. Not sure you can get this working without more filters then you would want to use.

Dear John,

The problem of reception of a two meter signal through the HF/6m antenna pigtail is serious enough. THere was no danger of 'Ouch" to the finals then. However, since you raise the question...

Check the circuitry on the diagram that ends with the HF TX and U?V TX. Follow it back through the HF PA and U/V PA to the controlling circuitry. See what safeguards are in there, or ...
Read the manual, specifically page 12-Antenna Considerations (top left, top paragraph). You will find that Yaesu expects this radio to be used mobile or at least roughly, with consequential problems between the power stages and the antennas. An open pigtail has a minimal capacitance. It appears as a very high impedance to the power stages, ergo a high SWR. The power stage protection mentioned in the manual cuts in at an SWR about 1.5, and reduces power out steadily past that point. I wouldn't guaranteee protection with a shorted output, but I wouldn't be surprised. An open pigtail should be no problem. Try steadily increasing your SWR using your antenna matcher and watch the output power drop. I would recommend starting low (< 5 watts) and building up. Keep in mind the ATAS-100 on a reset will fully lower the antenna shaft before starting a recalibration. The SWR
there will be over 5 on some wavelengths-no damage expected.

Oh yes...

Do use a duplexer on a single antenna whenever possible.

This problem warranted looking into. I was looking for feedback from members of the group with more experience and/or more testing equipment than I have. From the responses thus far, there may be some good come from this problem I had.

73s,

Bob Hawkins

Hello,

I too can confirm that reception of 2 metres is very possible with a VHF antenna connected to the HF/6 pigtail.
Discovered this in error and it was not immediately apparent to the ear.
Signals on 2m were at the time quite weak.

Andrew.

Hello All,

I am in the process of trying to wire my desk mic to my new ft100..
My first attempt failed..

Does anyone know what connection for "ptt" is?? I know the "mic in"
but I can't figure out which connector slot is for "ptt"...In
the manual it shows from left to right...SW1, MIC IN, GROUND, +9V,
N.C.(no connection?), SW2...Of these six, which is the "ptt"??

Another question is, do all these wires have to be connected to make
any mic work?? My desk mic has only four wires and the last radio it
was connected to only needed 3 wires...Mic in, ptt and ground..

Thanks for any help, I'm going by trial and error... So any help will
be appreciated!

N2TIF,
Paul

Hi everyone,
I am in the market for a "dc to daylight" rig, and it is down between the FT100 and the IC706 (hummm, are there others?)

I have not been able to get straight answers via email from the dealers, does the FT100 allow programming/CAT control from a computer? Does it have a "data port"? What do I need to do to have the computer talk to the radio?

How about antenna tuners, which one does what? What options should not be optional (ones that I cannot live without:)

I hope that someone who really knows will let me in on all the little details.

TNX,
Bob

Hi Bob, Well, here is my honest opinion of the FT100D. It is a fine radio. I just bought mine two weeks ago (won another so this one is for sale on EBAY). It does everything they say it does. It covers DC to Daylight and then some. I have used mine on all of the ham bands, CB while traveling, and on our 800Mhz frequencies. I find the menu is easy to use, but set all of my favorite functions in a memory and then don't have to do anything but bring up the memroy and then tune around. The DSP is great, the noise blanker actually works, the Auto Bandpass likewise. It sounds good on AM shortwave bands, and the built in keyer also has canned messages you can change. The mike has buttons that you can program, and it even has an auto CW id'er. You can adjust the display brightness, and anything else you can think of. Power, compression, deviation, all of that. It has a built in band scope for checking the band for activity. You can program it, with aftermarket software, using the data line on the back. The various antenna tuners work, the ATAS 100 is fully auto with this radio. it has separate antennas for HF/6 Meter, and one for 2/440. Some think this is a drawback, but I already had a two meter antenna on the car so just plugged it in. Didn't need a duplexer. Being from the old tube ham radio era, this radio is amazing. I liked the audio on receive, and all transmit reports gave good audio. I guess the bottom line is, find what you like and go with it. Sorry I can't help you too much on the 706. Used one side by side with the FT100D in Cleveland, and the Yaesu was the one I felt best. So, hope this helps. And if you need a deal on my spare, let me know, also am using the Outbacker Perth Plus and MFJ power supply. See ya, 73 de Jeff WB8QYT

Please try following connections.
I've got this information from WDXC desk of JA's Yaesu.

I made this, and It works very well with my several Yaesu's
standard 8pin mics, Heil Proset and MFJ's voice keyer.

```
---------------
FT100 6Pin Yaesu 8pin

|--[47k ohm]--|
(SW1) 6 --| |--|---------------------------- 6 (PTT)
|--[56k ohm]--| |
|--[39k ohm]---|------------- 3 (DOWN)
|
|--[82k ohm]-- 1 (UP)
_____________________________________________
(MIC IN) 5 --)-----------------------------------------)-- 8 (MIC)
|~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~|
(GND) 4 --| |-- 7 (MIC GND)
|
|-- 5 (GND)
|
|-- 2 (GND)

or if your microphone requires DC,

(9V) 3 ------------------------------------------------ 2 (5V)

and

(9600BPS) 2 [NOT USED] [NOT AVAILABLE] 4 (FAST)

(SW2) 1 [NOT USED]
---------------

5009. ATAS-100 on 2m and 70cm

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-10 12:15:36 UTC
From: Ignacy Misztal
Topic: 5009 Message: 5009

Should ATAS-100 be retracted on 2m and 70cm? Should it do it automatically? On my FT-100, the tune button on these bands does not work. Also, SWR on 2M is about 2.2:1.It seems to be independent of the position of the antenna.

Hi Bob,

If you are thinking of an outboard autotuner for either rig check out the LDG AT-11MP. I have a friend who took his FT-100 to France and did not have good luck tuning for different conditions with the Yaesu Autotuner. I just purchased the AT-11MP and am using it in the house with a 706Mii-G and it has a much broader tuning range than the autotuners in my 1000mp or my other rigs. It comes with a interface cable that allows tuning from the front panel of the 706 and I believe you can also get a cable for the FT-100 (check with them to be sure). I also have one of the early model FT-100s in my Jeep with the ATAS-100 antenna and it has worked flawlessly from day one. It is a great little radio and I feel it is easier to operate from a moving vehicle than my 706. Both rigs have their strong points and I'm not sure what your needs are (base-mobil). See if you can find one of each to try is the best solution.

Good luck es 73

I have to pipe in here, becuase the answer "yes" to programming/CAT control
is really a "yes-n-no".

There are a multitude of CAT commands and inquiries. Possibly no software
has been written to fully exploit all of them BUT there is no provision to
read or write the 300 memories, a function often called "cloning". Some of
us users feel this is a handicap, but I doubt it was enough to sway anyone
from the otherwise cool rig. Just a nit to pick.

I second Jeff's opinions. Love this radio. Have used it for HF mobiling
as
well as VHF grid hopping.

Hello Aki,

Thank you very much for the information.. I am very pleased that you
took the time to send it to me..

I will take your information and try to build an interface for my
desk
mic.. I have one question.. On sw1 "ptt", is that a "47kohm" resistor
or a "27kohm" resistor? I have seen some other information and there
it states that it is a "27kohm" resistor in series with "ptt" switch
to ground..

Please confirm about the resistor in the "ptt" circuit..I am sending
a
file that a friend of mine sent to me..Please check the "ptt" circuit
and let me know which is the correct value. I am confused about the
value of the resistor..

Thank you again, Aki...And Sayonara from Paul in Buffalo, Ny USA!

N2TIF,
Paul

In the figure, I received from Yaesu, the SW1 is connected to the
PTT through the parallel of 47k and 56k registers. The approimate
value of the parallel is 25.6k ohm. I think this is in the range
of 5 to 10% precision of 27k ohm. So the PTT may work well both of
27k or the parallel registers.

Any way, the Yaesu official WDXC desk sent me the curcuit diagram,
which has the parallel register connection instead of single 27k
ohm register.

It's your decision, parallel or single.

de JA9SCB, Aki.

FT-100D Replacement Cover:

I have held off updating the group as I was hoping to have good news, but...

All the parts necessary to supply the replacement cover/speaker are not available.

Yes, the speaker and cover are now here in the states, but the speaker lead with plug is not.

The assembly also requires 2 speaker mounting brackets and 4 black screws (supply of many of these are limited).

Between the speaker and the top plate is a black cloth mesh, which is not available.

Also, inside the top cover you will notice quite a bit of copper foil which grounds the top of the radio to the casting of the radio body when placed back on the radio. This foil (which in my opinion is VERY essential for grounding) is not available.

WE all know that there is / may be some grounding issues with this great unit and the antenna, as we have seen from many posts and I would hate to see someone install this replacement cover / speaker without all of the information needed to do the job correctly.

My original plan was to purchase all the components to this assembly and sell the unit completely assembled. But until all the components are in the states I would not sell incomplete kits of assembled products.

Ideally, Yaesu should sell the units completely assembled with one component part number and insure many less operator problems. I have asked them to consider this.

To obtain all the parts (and foil) it should run over $50 per radio. Is it worth it? I am not sure.

This is a great little radio, I have played with a few friends units. It is certainly on my Christmas list. There also has been a lot of posting about the differences between 100 and 100D units. From my contacts at Y, the only difference are the speakers and installed filters. As with all Radio made by all manufacturers their are always small running changes (or factory mods) to all radios.

If you are familiar with the Kenwood Service bulletins you will see numerous little factory mods done in each model over it's lifetime. These are not major board changes, but a cap here or there, different value replacement.

I am sure that this has been done with the 100, but since Y doesn't publish it Service Bulletins we will never really know.

5027. RE: ATAS-100 on 2m and 70cm

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-11 18:20:37 UTC
From: emoxon@alum.mit.edu
Topic: 5009 Message: 5027

Hi Ignacy.
I think others have said it doesn't seem to matter if it's retracted. Quite a few have advocated using a separate 2m/70cm antenna.

The ATAS-1 menu setting, meaning one-antenna-for-all-bands, allows the TUN button to still 'work' when the frequency is 2m/70cm: pressing TUN will put the antenna into a timed retract cycle without transmitting. In ATAS-2, the TUN button won't do anything on 2m/70cm. By the way, that seems to be the entire significance of the -1 vs. -2 setting. I use the -1 setting even tho I have 2 antennas, and hitting TUN is just a convenient way to retract it without transmitting.

Another thing is that in the fully retracted state, the sliding contacts in the stalk are positioned so they do not make contact with the coil/whip assembly, i.e. there is no d.c. connection, so any coupling to the whip is only parasitic.

Some related info re the quirks of ATAS operation is in Lee's FAQ:
http://members.home.com/k0lee/ft100faq.html#autotune

I wonder if anybody can provide a description of how the ATAS-100 works with the FT-847, and how it might be different from the FT-100?

5029. VOX

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-12 01:48:48 UTC
From: Pres Waterman
Topic: 5029 Message: 5029

Tonight about an hour before the shuttle launch I decided to go down by the water to see it pass overhead. I needed a way to monitor the shuttle audio feed remotely. So I connected the CT-39 packet cable to the line out on the satellite receiver receiving NASA Select TV. I connected the packet audio in (brown is ground, black is audio in) and it worked great. All I had to do was use the menu to turn the AFSK audio down to "15". I can transmit shuttle audio from the FT-100 and at 10% output power the rig was reasonably cool after an hour transmitting.

Unfortunately, VOX does not work! It does with the microphone. But the AFSK audio in is muted unless the red wire in the CT-39 is grounded, causing PTT. If it is not grounded, no external audio plays. Also, if it is grounded and on the air, pressing the PTT on the microphone replaces the external audio with mic audio.

So, without constructing a VOX circuit, do you think there is a solution?

OK, I have decided, I have ordered a FT100D and a AM filter -- before you jump to assume anything, I LIKE 6M AM! - there are a bunch of antique Ham there that just do not care that there is SSB or FM.

I want to use this on PSK as well as Packet etc... I have not been able to get the full idea of the data jack/6 pin mini DIN on the back. What is on the mini DIN? PTT, RX Aufio, TX Audio, GND???

I have seen several FT100's on PSK and never thought to ask how they interface to the radio.

TNX,
Bob

perhaps I should have asked the question with few words.

DO I NEED THE CT-39 (I think that is the number) THING TO PLAY PSK and
RTTY
and keyboard CW?

Hello,

Have not yet made the mic interface but have tried to build a soundcard digital interface to connect to the digital jack on back of the ft100... Guess what! Can't get the radio to key with the "ptt" circuit on the digital jack..Can't even get any audio out to my computer soundcard program!

Anyone have any info to help with this problem??

N2TIF,
Paul

hmmm.... I am using mine on packet through the digital jack. Check your PTT levels make sure it is changing, and check your grounds. If that don't work recheck your wiring with the manual.

One other note be sure to recheck your function menu settings for Packet and FSK.

5037. 10 meters/SWR

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-14 01:38:43 UTC
From: mountainranch@hotmail.com
Topic: 5037 Message: 5037

I just got the FT-100D back from Yaesu for HiSWR fix and it didnt work, I am feeding it into a beam with a swr of 1.2-1 and G5RV/AT-11MP with SWR of 1.4-1. A phone call to Yaesu resulted in "send it back" and "We cant garrentee it will work", thats lame, pure and simple. I really wished I was one who got a radio-NPF. Back to Yaesu...again.

5038. FT100 vs FT100D

Yahoo group: FT100 (1998 — 2000)

From: Bob - K8YS
Topic: 5038 Message: 5038

I see that there is a $200.00 price difference between the FT100 and the FT100D.... is the D worth $200 more??

(well, maybe it is NOT exactly $200.00 --- one is quoted at $949.95 and the other at $1139.95) I was told by the salesman that the only difference he knew of was receive audio. Did they change the speaker location or rework the audio?

Right now I cant recommend either, see post 5037. To answer your question, the FT100D has a larger speaker, 500hz CW filter, TXCO-high stability reference oscillator, and CTCSS decode. I believe if you add in the cost of the added items it all works out, your call. If you do get one, I hope you have good luck with it, because if the transmitter was stable, it would be one great rig.

not everyone have stability problems. I use mine mobile and here in the apartment with a loop stapled to the ceiling. I have not had the high swr problems. I have had a few cases of RF feed back with the FC-20, but a ferrite core on the control cable fixed it. other than that I use mine 160 meters - 70 cm, even 17, 15, 12, and 10 meters where several have had problems.

I would recommend the 100D.

5042. Re: Ant1/Ant2 Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-14 17:45:23 UTC
From: kc0fvm@arrl.net
Topic: 4990 Message: 5042

Hi,
I have tried a similar arrangement, but with two antennas.
My rig is an FT100, with an antenna switch in the HF/6m
pigtail (an Alpha-Delta Delta-4). I switch between different
HF antennas and tried hooking up a Comet SB-15 with a ground
plate to check 6m performance with something that could be
used portably. I have either a Comet SBB5 or a quarter-wave
ground plane (Armstrong switched) on the U/V port. I have been
able to see output power drop and input sensitivity fall when
the SB15 is attached to the HF/6m port while either VHF antenna
is used on the U/V pigtail. I had tended to attribute this to
either issues with grounding or antenna interaction. My antenna
analyzers also showed very low VSWR on the three bands of the SB15,
SBB5 and homebrew antennas. I do not have 10m or 17m oscillations
with this configuration, but low (or unit-to-unit differences) in
port isolation could be involved.

Have you considered simply tuning a 100+ inch stainless whip
or a Hamstick for 6m work with the HF/6m port and put your SB14 on
the U/V port for 2m/70cm work?

Hi folks,

Now, I have had all the problems one can get with the FT100. Won't mention any of them !
Bought in April this year, it was my first modern transceiver and my first Yaesu. Must admit I thought I had made a big mistake. Still think I have.

But.

I now have the 847. A touch more expensive but a wonderful bit of kit that actually does everything it says it can. My confidence in Yaesu is restored.

OK. The 847 is what, three times larger, but not enormous, so I have come to the conclusion that you just cannot pack 100 watts of RF into a tiny package. Not yet at least. When all is digital it just might work.

The 100 rests dormant on the shelf for now. Any offers ?

Jerry -

Everyone sucks from time to time - so do you and so do I! But most of the time we all all okay; so are you and so am I. So, there you are ... take us or leave us, or understand that when someone pays over $1000 for a new radio and it doesn't work ... they tend to get testy.

I was lucky, Yaesu flat out told me that they just couldn't fix my radio's problem, whick they said all FT-100 have to one degree or another, and they offered me my money back. I took it! I my buy the "D" model but the problem is still there - that is their own words. It is a nice rig, but it is not market-ready - in my opinion. I would like to see the percentage of new FT-100s that have to go in to the shop for one reason or another. The numbers may or may not be out of line - we just hear about the problems on lists like this - and that ain't all bad. A new buyer should "beware" and understand the situation. I went in to it with both eyes open and my FT-100 never had any of the problems that I read about here. I had to go and find my own! Go figure... At least most everyone else had their rigs back from Yaesu within 2-weeks. Mine was in for 6 weeks and they still couldn't fix it. They did not even try 'cause Japan told them that ... "that is the way it is out of the box and there is no fix for it". They left me little choice but to take my money and run.

So I hope that think it over and if you leave the list - best wishes and God bless.

I was considering the standard 1:1 xfrmr on input and
output, with varistor.....
But has anyone had successess using the levels on the
datajack for sstv/psk etc?

Just finished my PSK box for my older FT-757GXII, and will
try it soon..
Should work... unless the levels are too low...

The Fall/Winter AES catalog has a Kenwood ad showing the TS-2000 All Band, All Mode Transceiver.
HF, 50 - 1200 MHz.

As stated, the radio has not been FCC approved when ad was posted.

Anyway, it looks like there is a TS-2000 afterall.

This may explaint he suddent price drop in the TS-570-dg at $ 950 and
the TS-570 DS at $ 1150 at a few USA Dealers. HMM I knew somenthing
was up.

For what it's worth.....

I am using a 20M hamstick and an SGC-237 remote tuner with my FT-100. The tuner loads the 'stick on ALL bands, including 160. Excellent reports. I tried to load an 80M 'stick with the tuner. No luck. The same for a 40M 'stick.

I have not used the VHF/UHF side of the radio as of yet because of a dual-bander previously installed in the mobile. I have heard these is a bug in the 440 side of the '100. I guess, in due time, I will find out for sure.

If someone can get the FCC reg numbers on the back of one of these units,
you can view the specs on the FCC website.

http://www.fcc.gov/oet/fccid/

They may show the unit at the Pacificon show.

Andrew,
Since you say you have problems with it and not knowing what condition it
is really in, I'll start at $500 US.

Please
respond to
FT100

Hi folks,

Now, I have had all the problems one can get with the FT100. Won't mention
any of them !
Bought in April this year, it was my first modern transceiver and my first
Yaesu. Must admit I thought I had made a big mistake. Still think I have.

But.

I now have the 847. A touch more expensive but a wonderful bit of kit that
actually does everything it says it can. My confidence in Yaesu is
restored.

OK. The 847 is what, three times larger, but not enormous, so I have come
to
the conclusion that you just cannot pack 100 watts of RF into a tiny
package. Not yet at least. When all is digital it just might work.

The 100 rests dormant on the shelf for now. Any offers ?

Andrew. G3OUT

5064. FT-100 Micro upgrade ???

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-17 12:09:59 UTC
From: hduff@ica.net
Topic: 5064 Message: 5064

Andrew;
Don't you know... this reflector is all about FT-100 owners
complementing each other on what a great rig they each own.
We'll have no anti-FT-100 inuendoes now Andrew :)

So when is Yaesu coming out with the FREE microcontroller upgrade for
FT-100 owners which will include memory manipulaton by CAT ???
They did a similar thing for the FT-847 so it shouldn't be an issue
for us FT-100 owners !

I'm tryiing to stir up interest in this but do I think this would
ever come to fruition ? I doubt it. I'm the only one that seems to
be ticked off about this.

Maybe I should offer mine for sale too...it's been "fixed" and works
"as good as it ever will"....offers ?

5065. Low Audio using External speaker

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-17 12:21:42 UTC
From: Jesse
Topic: 5065 Message: 5065

I got my FT-100 10/13/00 and used it all weekend.. I tried to use my HF mobile antennas with it with no luck. I have a set of Hustler 75/40/20 mobile antennas which are tuned to the middle of the band... With my FT-890 they work great execpt on the 20M band where I have a HUGE TVI problem...On Sat.. bought the ATAS-100 and put it on top of my RV with no problems on all the bands. Ran the PA QSO party for a few hours to stretch my legs on the radio and get used to it.. Logged with the radio ... All in all it was a experience!

However... I am having a audio problem when using a external speaker. when I turn the volume of more than 50% there is not much of a volume increase. I know the 847 had the same problem when using the headphone jack and there was a fix. I have not dug all the way threw the archieves but making progress.

Also, another problem I am having is the S-Meter on the VHF/UHF side does not seem to register correctly.. However this is not a problem.. Works fine on the HF side.. I did a Signal comparison between my FT-890 and FT-100 and the 100 was able to pick up signals that the FT-890 was not able to. But the S-Meters matched on the HF side.

Jess

CAT was an important consideration when I bought the FT-100
(In fact I bypassed the FC-20 tuner because both wouldn't
function at the same time).

I also a unhappy there is no memory management features via
CAT. I'm hoping that there might be some 'hidden' commands
tho.

My FT-757GXII supports CAT and the commands are neatly 01h
through 10h including 0Bh for M<>V (the VFO/Memory Swap
command

The FT-100D are spread out much higher with big gaps. Room
for hidden commands? I haven't had time for experimenting
now that the FT-100D is mounted mobile.

I am not sure what the best way is to get the message to
Yaesu. How did the FT-847 owners do it?

It's important to recognize that even though Yaesu added the 'cloning' feature to the FT847, there are no commands to access the memory locations on that radio. You can control all the other radio features via CAT, but not the memories. What Yaesu would need to do for CAT control of memory locations is add commands to access the memory locations.

Otherwise, we'd have the same situation as the FT847 which is also lacking a commercially available solution to storing and retrieving memory locations.

Actually, if the radio can be 'cloned' it can also be programmed. Its simply a matter of dumping the clone info to a PC, reverse engineering it, then sending the info back to the radio.

This has already been done for the 847. If I remember correctly, the hardest part was figuring out the Yaesu method for detecting a corrupt clone. It wouldn't surprise me if the exact same method for setting the FT847s memories worked for the FT100.

I could do the programming end, but I know that I don't have the time. Have a chat with the 847 group at
http://www.en.com/users/rayd/ft-847/wwwboard/wwwboard.html
they can probably lend a hand.

Hugh,

Your words " as good as it ever will" are, well.....apt !!
Let's let it lie. So we don't have to talk about it any more !!

As Denny remarked, "it is not market ready". But I own one and have to make
a decision as to what has to go and to where !

Since Yaesu US monitor this reflector, Mike, what do you have to say ?

My FT 847 is wonderful (encore)

Andrew.

Lets face it people, Yeasu screwed-up on this radio and used the Amateur community as their Quality Control if you will! The FT-100/D's have multiple problems in design that Yeasu can't readily rectify without totally re-designing the whole radio from the ground up! So there just letting it ride until another model replaces it. Lets hope the FT-817 is ALOT better and works as it should and not released to the Amateur community until its 100% tested! Yeasu, you listening!? You can send me an FT-817 for testing if you want...I'll put it through a REAL test and let you know what needs your attention before you release it! Just ask Jeff in service about my comments to him about a year and a half ago regarding the FT-100 and my LOOOONG list of items that needed your attention. I think after loosing around $1000 in various expenses I'm entitled to a free FT-817 for all my hassle's with the FT-100 serial # 9D021550 I used to own but Smoked on my desk..plus the second one, etc, etc, etc...

73's
de Rob
ve4rrb

P.S.
After a year and a half can you still feel the anger I have toward Yeasu and there so-called great customer service. Why didn't Yeasu just give me my money back like they gave some other's and save the song and dance for another day!? Jeff...your still a liar buddy!

Hugh,

Your words " as good as it ever will" are, well.....apt !!
Let's let it lie. So we don't have to talk about it any more !!

As Denny remarked, "it is not market ready". But I own one and have to make a decision as to what has to go and to where !

Since Yaesu US monitor this reflector, Mike, what do you have to say ?

My FT 847 is wonderful (encore)

Andrew.

I agree. I have not had a problem at all With my 100D. I believe the numbers show us that more people have good luck with them than those who have had problems. Some people are always griping about their 100's. Maybe they should sell the radio and get something that they are happy with. There are several on this list that are the first ones to give nothing but negative attitudes towards the 100, almost like they believe no has ever had a 100 that did not self destruct.

If Yaesu made such a bad radio, then why do you own one? The few problems I have had were due to bad grounds on the antenna and at the radio, when I fixed them all my problems went away.

now i may be all wet, but i don't think rob's main point is how crummy the ft-100/d is just because his has had some problems. granted, in light of his misfortune, he probably does think that the ft-100 is junk, but i don't think that was his main point. i think he was trying to vent how poorly yaesu is handling his problem. especially in light of the fact that yaesu returned the hard-earned money of some customers but didn't in rob's case.

now i'm not saying that rob's story is 100% accurate (neither am i saying that it isn't). after all, we haven't heard yaesu's side on the matter. all i'm saying is that, i think rob's email is trying to communicate that yaesu didn't give him what he paid for, a rig that works as advertised. whether it's right out of the box as some/most of us have, or within a reasonable amount of time after yaesu has the opportunity to make things right, and according to rob, *yaesu has left him hanging.*

as for me, well i'm still trying to decide if the ft-100/d is for me. i feel that this group has been a tremendous help in providing all kinds of info. both positive and negative that will help me (and others) make an informed decision. so even though i don't yet own an ft-100/d, i have experienced the *that's never happened to our products before* syndrome with both ham and non-ham products.

so i know how rob feels. those of you who feel that he is simply *griping* may be right. however, i choose to give him the benefit of the doubt and am viewing his email to be one of a warning to us based on his experience, and not one of *griping.*

sorry for the length,
73's,
j

I said that there are no "commercially available" programs to store and retrieve the memories on the FT847 so, if you didn't understand, perhaps I should say it like this:

J'ai dit qu'il n'y a aucun programme disponible dans le commerce pour programmer les m?moires sur le FT847.

The point I'm trying to make, which you chose not to mention in your message, is that the menus of the freeware program you refer to (and all its instructions) are written in French.

Perhaps this is all that people would require to stop the complaining about the lack of such a feature. However, if I paid for a program, I'd expect it to be available in a more commonly used language, i.e., Urdu. :-)

After reading through the instructions on how to run this program (http://207.206.11.2/ft-847/software.htm#Edit) I decided that I didn't need to store the memories after all. It seemed like it would be less trouble to reprogram them if I ever needed to restore them.

The only FT100 information I've read on this forum from Rob is spleen-venting and I'm really tired of it. The last time I brought up the fact that Rob was using this forum as a pulpit to exact revenge (which he has done repeatedly) he accused me of being a communist.

Rob, you got your money back for the radio and so why don't you just drop it since I am tired of hearing the same story over and over. A lot of us are happy with the radio and didn't have them go up in smoke. You are the only one who has ever complained of 'smoking' an FT100 (twice!). Sure, the radio has had a few teething problems which virtually all of us have been able to get fixed for free, so YOU are the exception. The point of this forum is to HELP other owners and prospective owners, not to harp on our own misfortunes.

Maybe Yaesu mistook you for some kind of idiot complaining about the radio without a clue as to what you're talking about and that's why you weren't treated as well as you might have been. If your behavior on this forum is any example of how you go about trying to resolve a quality problem, I can see how one might draw this conclusion.

You allude to your out-of-pocket expenses and I can only assume that this is related to the fact that you DROVE 700 miles roundtrip several times to buy/exchange the radio in the U.S. (presumably to avoid taxes/customs in Canada) and if you think anyone would compensate you for this then you've confirmed my suspicions about your sanity.

As for getting a new 817 for free, if I were about to introduce a new rig, you'd be last on my list for testing it.

Same here- been a terrific radio that I'm very happy with. I wish that we had kept up the serial number listing. This list, for understandable reasons, sometimes becomes little more than an endless problem reporting list, but when someone started maintaining a list of serial numbers of the members of the list, setting out the serial number, and if problems had been encountered, the list showed that the vast majority had not had problems, and that was just those that did report. I suspect that those who are happy with their radio say little on the list, whereas those who are unhappy say (for obvious reasons) quite a lot on the list.

That said, it does appear that there are some problems, and that for the most part those problems show up early on. At least that's good news for those who are going to encounter problems. I'm happy to hear of the problems, so I can watch out for difficulties on my end. However, I hope that it won't turn others who are interested in the rig completely off of it, given that the problems noted are far from universal.
William

Oh great idea Tom..... Now the list will be full of; "My rigs great" "My rig's broke" for the next few months.

Can't we just accpet that some people are unhappy with the rig and some are over the moon with theirs, do we really need to know numbers?

I'll be ditching the list for a few weeks to let things die down.

Yes ,
Same here works great on 15-40 & 6 meters with a little manual adjusting,
but 10 meters is
completely unusable. I have had the swr mod done. I placed a dummy load in
my trunk and it works
so the problem is with the antenna.

Actually, there is a poll which is still open that has quite a few of responses. You can find it in the polls area of the list. See the Polls area at:

http://www.egroups.com/group/FT100

Here are the choices under the poll:

My Ft100 (fill in the blank please ALL OF YOU) ?
Never Broken.
Broken more than once.
Been exchanged for an ICOM
What FT100 ? I dont own one yet.
Works FB.
Will never break
Has broken several times but now it works FB.
Has broken once and now works FB
was broken and replaced
more than one broken and replaced
replaced more than twice

The results are:

Never Broken. 70 41.42%
Broken more than once. 10 5.92%
Been exchanged for an ICOM 3 1.78%
What FT100 ? I dont own one yet. 15 8.88%
Works FB. 42 24.85%
Will never break 1 0.59%
Has broken several times but now it works FB. 0 0.00%
Has broken once and now works FB 17 10.06%
was broken and replaced 5 2.96%
more than one broken and replaced 4 2.37%
replaced more than twice 2 1.18%

There are currently 169 responses so please go ahead and vote if you haven't done so already.

I am having too much fun with the K2 and the FT100 is sitting idle! Since I now have a "winter" vehicle I am thinking of moving the FT100 mobile with the ATAS100.

The "winter" vehicle is over height as it is and what I will need to do is mount the ATAS100 on some sort of mount on the roof rails which can fold horizontal against the roof when not in use. Seems to me I have seen Comet or another manufacturer makes such a mount that is motorized in some fashion allowing remote control from the inside of the vehicle-has anyone had any success using such a mount?

Anyone mounted a ATAS on a LR Discovery?

I use a mag mount on my suburban.
I have a Wilson 1000 for 10M and I just unscrewed the antenna and put the atas-100 in its place .. holds very well 90+mph with a 40mph cross wind ..

5091. Free FT-100 Micro upgrade

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-18 16:35:22 UTC
From: hduff@ica.net
Topic: 5091 Message: 5091

I was reading over the last batch of postings and it occurred to me what the root of my discontent really is. I think it boils down to this:
Yaesu made a HUGE mistake in marketing the FT-100 while it was probably only in the early conception stage. Trying to capture the wave of success that Icom was enjoying with their popular IC-706, they decided to make a similar but improved radio in that class. I understand the marketting strategy, which is to hook prospective buyers of competitor products to wait it out for your new product to come to market, but I believe it was done way too far in advance, in the case of the FT-100. It was well over a year after it's announcement when they finally appeared in the stores. Most certainly, the pressure was on the engineering team to get the FT-100 out, by Yaesu marketting. I know of several people who, after a long wait, actually got tired and went ahead and bought and an Icom IC-706, since the FT-100 was still "vapour-ware".
Without doubt, cramming that much functionality into such a small space is an engineering mavel. However, I bought an original IC-706 when they first came out and I don't recall there being noteable quality and design problems as there was with the FT-100. It's unfortunate that we were the BETA TESTERS (guinea pigs) for the FT-100. I never felt that way about my Icom IC-706 (and I don't believe I was lucky" not to have had a problem). I hope Yaesu learned a big lesson from this.

I had trouble with my FT-100 as soon as I got it but it has been 'fixed' and seems to be working. Not so fortunate is a long time friend of mine who has had nothing but problems with his. After Yaesu tried to fix his original FT-100 a couple of times, they gave him a new unit. The new unit has been back to the shop a couple of times and now the dealer has told him that "You're on your own now"...ie...they're tired of dealing with it (losing money ?) and have told this fellow that the problem is with the operator or the installation. I've known this guy for 20 years. Aside from the odd esoteric problem with previous radios which any of us may have experienced, he has not changed the way he operates nor his installation procedure (he has had several problem free mobile installations over the years). Yet, he has had nothing but trouble with his FT-100 and now he's being put out in the cold. He says he wasn't aware that "1 year waranty" meant if you've had ongoing problems from day one and the product has been back and forth to the repair depot and to the factory, that when the year expires, the vendor is off the hook. Knowing what I do now, having experienced problems of my own and by hearing of other unhappy FT-100 owners, I feel sorry for this chap. That's *quality* cutomer

service ???

To repeat myself, I'm not anti-Yaesu...I'm quite happy with my FT-847 and VX5R HT. But from my perspective, if Yaesu is so interested in making their customers happy as some of you have pointed out, I' like to see them put their microcontroller programmers to work in coming up with a proper, non-cludged CAT memory management or cloning feature for the FT-100 (the harware is all there), and offer this as a free upgrade to present owners. Since loading memory channels is a very cumbersome procedure, especially since there is no keypad (another oversight...the DTMF pad on the mic doesn't provide data input), it is a very desireable necessity, not 'feature'. Apparently there are Yaesu eyes on this egroup. Please pay attention to this request ! Aside from the quality problems/ design flaws, it is a real sorepoint, even for those of us who are fortunate enough to have a working FT-100. I'd consider it a customer appreciation 'gimme' for the many of us who had to deal with a 'problem' FT-100.

From: hduff@ica.net
Topic: 5064 Message: 5092

Settle what question ?

I think it goes without saying that this group exists maily for those who like the radio and wish to share 'happy thoughts' about operation and installations. One would like to think that most subscribers are here as content owners with a few (like myself) who are here (for lack of anyhere else to possibly be heard by Yaesu) to voice our concerns over problems with the radio. Perhaps an unfair captured audience to raise such a poll.

5093. I wonder if Yaesu is listening.

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-18 18:19:34 UTC
From: David Alden
Topic: 5093 Message: 5093

I've been monitoring this reflector for several months now because I have been considering the purchase of an FT-100. I don't really need one but I would like to have an all-bander in my car.

I have listened with interest to all the pros and cons of the FT-100 and have finally decided that if I do buy an all-band mobile it will probably be an Icom-706.

Don't get me wrong, I think Yaesu makes a wonderful product and I'm sure that there are just as many people who are happy with their FT-100 as there are who have had problems. I currently own 3 Yaesus and here is my experience:

FT-990: Bought used, a few months old. A wonderful radio for it's vintage but shortly after I bought it there was a "firmware" update that allowed 2 way communication via the serial port. Not a big deal but a little dissappointing since I was not the original owner I could not send it in for the update without paying for it.

VX-5: Purchased new. Had to send it back for repairs immediately because of several problems including it would spontaneously turn itself off and the only way to turn it back on was to remove and replace the battery pack. I was without my brand-new HT for 3 weeks while they fixed it. It has worked fine since then but who wants to have to do this?

FT-847: Purchased new. A very nice radio but again, shorly after I purchased it there was a firmware update and there are several annoying bugs that have been corrected on subsequent serial numbers. Among which is a volume control that simply cuts off below a certain volume. I never sent it back because I just didn't want to be without it for the 3-4 weeks it would take to get it back.

I think that Yaesu definitely makes a cutting edge product but I just don't want to pay them to participate in a QC field test. I don't think that I should have to scour the internet to find out what problems and defects that I need to look for once I get my new radio. Some of these problems are somewhat obscure and might not show up until you have been using the unit for several months. Hey, these radios are awful darned expensive and it doesn't seem right to have to worry about this stuff.

I'm sure that Icom has occasional problems with their units. Maybe they are not quite as slick as the Yaesus but every Icom I have owned has worked as promised right out of the box. I've never sat around wondering "What the heck is wrong with this that I don't know about?"

Again, I'm not one to pay undue attention to complaints aired in mail-lists because I understand that the people who are happy with their radios don't

have much reason to comment. But, having had 3 Yaesus, all with major or minor issues, I have to give serious consideration to the other manufacturers.

I wonder if Yaesu really reads any of this stuff?

The deal with Yaesu is you have to sit and wait for the products to mature.
I bought my FT50 when the VX5 came out because I knew the VX5 would have
problems, after all, it's a new Yaesu. ;-)

If you don't need a new mobile rig, wait until the FT100 complaints go away.
I have a new SUV on order, I'll debug it first (as it always the case with
new vehicles), then look hard at the FT100 or the new Kenwood TS-2000.

How about this.

An automobile manufacturer produces a vehicle with a major fault.

What does he do ?

Recalls the lot.

Yaesu, you could do the same !!!

Sorry.....I said I would let it rest !

Andrew,

It is funny how those with fine working radios can't understand the frustration of those with radios that have major problems. They ask why
we bought one, resort to calling them names or try to discredit them. The FT-100D is my fourth yaesu(my other rigs were far enough down the production run that bugs were sqashed to a larger degree) and it wont transmit on 10-12 meters, period. YaesuUSA, on the phone, admitted that
they dont know what to do, unless Japan comes up with another fix as the grounding strap does not alway work.

My FT-847 has some issue that I was able to work out, ie. week power switch, headphone impedance mismatch, Microphone not disabling when using the DATA Jack, but still has an issue that has yaesu scratching their heads. These issue, although should of been dealt with already, are minor compared to the issues I have with the FT100D.

If yaesu hopes to keep its customer base, they need to do better in putting out a rig that is tested better, reliable and works out of the
box. I really like Yaesu styling, features and competitive pricing, but
they fail in quality and that alone has left me enough trouble shooting
and shipping back and forth to call yaesu quits on any new purchases.

I have tried different antennas, power supplies, length of coax, another hams antenna, ferrites, and for those who can tranmit into a dummy load, lets see you make a contact to europe with that.

Now if Yaesu can fix or replace my rig so that is operates and behaves
reliably, I will be content to use it and enjoy it. But I will never recommend one now.

Boy this has been an interesting discussion! I'm in the internet consulting business and I see the pain companies are feeling as they try to respond to market pressures. Let's face it - companies (automotive, electronic, etc.) are under tremendous pressure to bring products to market in months instead of years - it used to be that GM would take 4-6 years developing a new car line and once released, count on 10+ years of product life to recoup the investment. Today, 30 months to develop is old news, 24 months is typical and 18 will soon be the target! Are engineers today really that better at their jobs that they can produce in 18 months what used to take 50? Computers, CAD, and other forms of engineering automation help, but not that much.

Where does this pressure come from? Us! Well, us and Wall Street. We can't wait for Yaesu to come out with that sexy new micro-mobile because Icon/Kenwood has, and so what if there are some bugs in it because they're working on the next Icon-killer that you'll be lusting after soon enough anyway. Is this an excuse? No, but it does seem to be a reality.

I see it in Amateur radio gear, software, cars, etc. It gets pretty frustrating, but it has taught me to stay a bit behind the curve. I bought my 100D a month or so ago - a long time after the 100 originally came out. I still run my 990 and like it very much. I drive mid-90's cars that had been around for several years. I guess I don't like to be the first guy to get anything. I probably miss out on some neat stuff, but I do have fewer headaches.

Sorry for the bandwidth - back to your regularly scheduled reflector.

73!

-Brian n8wrl

Don't forget to add the FT-101 to list of problem radios produce by Yaesu.
I under stand the last units were fairly good after a lot of design changes along the way. After reading the list the last few days I would be afraid to by any new Yaesu radio. I have been fairly happy with the Ft-100 after sending it back because it was DOA. I am still not happy with the audio output level but have learned to live with it.

Ya! Funny how that's always the case isn't it!? Just like Lee Devlin giving me a hard time everytime I dare mention any problems with the FT-100's that I had way back when they first prematurely released them. I'm the nicest person you'd ever meet and yet I keep getting called a "whiner", "shit disturber" and a spleen-venting crazy person who probably caused my FT-100 to smoke on my desk! If anybody out there cannot think I'm justified in being a "little" up-set over having to go through what I'm now going to itemize then the heck with you! I'm pissed still to this day with Yeasu, and I feel I'm within my right to be so...period! And I also feel that my last e-mail posting to this group was in no way being a spleen-venting, whining, shit disturbing asshole like some of you have said to me in e-mailings here and to me personally! This is an open reflector for all kinds of information and talk, I'm I not justified in my two-cents worth within reason!?

Here is my reasons for being a "little" upset with the FT-100 and Yeasu USA...SORRY for the length, I'll not post it again.

1) Being that I live in Canada; I have everything shipped from Burghardt's where I normally buy from because of there GREAT service. I decided to drive down to South Dakota to pick-up my new mouth-watering FT-100 when they first became available. I was NOT trying to cheat Canada Customs of any money like some of you have suggested by driving to Burghardt's, I paid both tax's if you must know. If I had ordered it and had it shipped to Winnipeg, Manitoba where I live, I would have been waiting for about three weeks or so because of Customs holding it up and so on. That's why I drove to Burghardt's...not to smuggle the radio across the boarder. Plus I wanted this fantastic new radio NOW, and it was still not yet available in Canada so I had no choice but to go south for it. To drive from Winnipeg to Burghardt's round trip takes about 12 hours worth of driving and 1200 Km on the odometer, not to mention the time off work, gas, ware and tare on the car etc.

2) After a pleasant week-end in South Dakota and FT-100 in hand, fully loaded I might add I was home and reading the whole manual over before I even turned the radio on. I installed the options which I might add had a typo in installing the filters. The AM filter had to go where the CW filter went and reverse for the CW filter. I did however catch the very little piece of added paper tucked into the manual that mentioned the typo so I did install the filters properly the first time. I installed the TCXO which was very easy to do un-like the filter install, plus the CTCSS too. I might add I'm also an electronics technician and found the filter install time consuming but not un-reasonably hard to do, at least for me. I also taught electronics for a local school for one season, so I feel I'm competent in the field and not just causing my own problems from lack of experience. Anyway after all was said and done I was ready to turn the radio on and see how she worked. So far so good...no smoke, yet. I found the receiver was pretty hot and did love the DSP menu. I did however get a lot of IMD on 2/70 and found that the att/preamp didn't work in that region (not good). So for me 2/70 was un-usable on my dualbander low gain base antenna. Six meters worked fine for a quick QSO, so on to two meters I went. Well after about five minutes of transmitting on high I started to notice my receive going down hill and ALOT of smoke coming from the back of the radio. I must add my antenna was basically flat for VSWR on 2/70 and I had been using the same antenna with no problem with an Icom radio and amp for over a year. The final PA amplifier for 2/70 going up in flames was the cause of all the

smoke I found out later. It seemed the radio on two meters was drawing 22 amps for 50 watts output which was crazy...no wonder the radio burnt up! the radio was dead for receive and transmit on all bands now, but still lit-up. After calling Burghardt's for assistance they kind of felt that maybe I had done something wrong. I assured them I had followed everything to a "T". Burghardt's agreed to replace the radio for another one but they wanted to install all the options themselves just to make sure. I agreed to that and they assured me they would test it fully before I arrived to pick it up the next day.

3) Well I came and went from Burghardt's for a second time and all seemed well. burghardt's told me that Yeasu was having some troubles with the filter install and people were not being careful enough with the ribbon cables inside the radio. And that only a few came back as defective out of about fifty sold so far. When I got home I tried the radio to see how it worked and found out that Burghardt's own tech installed the filters in the wrong spots! (obviously the person didn't read the manual too good!). So no filters are working but the radio is working good otherwise. I talked on six meters for about fifteen minutes with no problems and had good reports of audio and signal in SSB mode at 100% output. So for so good except for the filter blunder which I was going to look into later myself. Off to SSB two meters for a quick test, but first FM. On FM two meters the radio still was drawing over 20 amps and I felt that was the sign of trouble...no doubt! I gave the radio a try on SSB full output and talked for around five minutes and low and behold, smoke all of a sudden again. The radio had burnt-up for a second time...same story but different radio! I must also mention that the fans were very noisy in a base/desk set-up. You would have thought that the radio was gearing up for take-off any minute!

4) Well here I'm sitting in front of yet another burnt-up FT-100 and on the phone to Burghardt's asking what I should do now. They told me that I would now have to deal with Yeasu and fight it out with them, plus they made me feel like I was causing the radio to smoke. I than called Yeasu USA in California and talked to Jeff or was it Jon Lynn the service manager for Yeasu. He told me that the radio was having some "issue's" and that he assured me my problem was an isolated incident. He also told me not to mention the problems I was having to anybody or the Internet reflectors! Now why would the service manager for Yeasu USA tell me not to talk about the problems I was having unless there was something more to just me having trouble with the two I went through...makes you kind of wonder doesn't it! I must also mention that the QST review was just released on the FT-100, and they gave it a thumbs-up. I e-mailed the editor for QST and told him all about my problems with the FT-100 over the last couple of weeks. He wasn't surprised to hear from me reguarding my situation. He and another fellow who did the testing of the radio also had there first test radio burn-up on them also and they had to get another one for testing from Yeasu. The service manager also told me to send in the radio to him in California and he would look after the problem. I felt Yeasu should pay the shipping charges to California after all I had now went through two radio's and many miles to and from Burghardt's plus my time and more money after I just spent over $3000 CDN funds and not even been able to use the radio yet for it wouldn't work long enough without burning up and I was in no mood by now to have to ship the radio at my expense from Canada to California at the tune of $125 CND shipping charges plus insurance just to have to wait two months for the radio to return to me...summer conditions on six meters was just beginning to start and I wanted a working radio NOW! I must mention that I was VERY civilized with the service manager for Yeasu, but I wasn't prepared to have to send in a radio at my expense to California especially when it was 1 hour old! I felt it should have been replaced for a third time at Yeasu's expense with a pre-paid return box for the dead one. Yeasu said that was an unreasonable request and obviously didn't go for it...great customer service eh!? So I called Burghardt's back and made mention of the mix-up in filters that were not put in properly. They couldn't

believe their own tech would have made such a mistake but finally agreed to one last kick at the can provided I went Icom 706G instead. So I asked why I couldn't try another Yeasu FT-100 and they said to me that they were now seeing alot of complaints about the radio and it would be best for me and them if I went the proven Icom 706 route. I agreed and now had to drive down a third time to Burghardt's and return the dead Yeasu FT-100 #2 and pick up my new Icom 706G with fully loaded options installed by them of course just to be sure. I would remind you that to ship the FT-100 radio to Burghardt's still would have cost me $125, so for the sake of time I chose to drive again and get it over with in a day.

5) The Icom IC-706G has worked flawlessly ever since and I find has way better IMD rejection than the Yeasu had while working. Plus an att/preamp that works in 2/70 and a good NB that doe's work on the "G" model. No smoke...No mirrors just what I paid for, a working radio as it should be! I must say that there was a $500 CDN difference more for the Icom, but at least the radio doe's work as advertised! I must also add that Burghardt's needs a hand of applause for being such good sports about all of this, as without them I would surly of had a real nightmare with yet a third Yeasu FT-100 at that time. They also mentioned that when Radio manufactures release products or for that matter anybody that cause problems for whatever reason, it affects everybody down the line. They also said that the FT-100 at release was one of their biggest problem radio ever for sometime. So all in all I spent a considerable amount of money, time, and frustration just to buy a radio. Now maybe you can all see why I felt I had the summer from hell with the little heart breaker - FT-100. Now some of you will be saying that I should have given Yeasu the chance to try and fix the problem. But I felt, and still do, that when you buy a new radio and it's defective right out of the box, you should be given another one...NOT have to send it in for repairs! The radio probably would have come back with other problems that I never had a chance to notice for lack of keeping it working long enough. Like the CW id'er u/w problem, CTCSS tone's that were off frequency, and other's I don't need to mention again. Not to forget the hassles of getting the ATAS working with the radio properly. As I see it there are all kinds of problems with the radio, some have them all, other's only a few, and some not at all. So how can you say there is not a Q.C. problem going on!? Just look at the FT-100D; if this was a totally up-dated radio than why are people still complaining of u/w CW Id problems still? You would have figured that Yeasu had fixed that along time ago...no? In a nut-shell, all I'm trying to say to Yeasu is smarten-up, get with it and make dam sure the products you release are working at least 99%, and quit using the amateur community as your quality control. If any of you who were able to last long enough to read this last part, and have question's I may not have answered than please feel free to e-mail me and ask as I probably have left something out along the way. Thanks for your time...again. :)

Subject: [FT100] Re: Poll ?

It is funny how those with fine working radios can't understand the
frustration of those with radios that have major problems. They ask
why
we bought one, resort to calling them names or try to discredit them.

The FT-100D is my fourth yaesu(my other rigs were far enough down the production run that bugs were sqashed to a larger degree) and it wont transmit on 10-12 meters, period. YaesuUSA, on the phone, admitted that
they dont know what to do, unless Japan comes up with another fix as the grounding strap does not alway work.

My FT-847 has some issue that I was able to work out, ie. week power switch, headphone impedance mismatch, Microphone not disabling when using the DATA Jack, but still has an issue that has yaesu scratching their heads. These issue, although should of been dealt with already, are minor compared to the issues I have with the FT100D.

If yaesu hopes to keep its customer base, they need to do better in putting out a rig that is tested better, reliable and works out of the
box. I really like Yaesu styling, features and competitive pricing, but
they fail in quality and that alone has left me enough trouble shooting
and shipping back and forth to call yaesu quits on any new purchases.

I have tried different antennas, power supplies, length of coax, another hams antenna, ferrites, and for those who can tranmit into a dummy load, lets see you make a contact to europe with that.

Now if Yaesu can fix or replace my rig so that is operates and behaves
reliably, I will be content to use it and enjoy it. But I will never recommend one now.

I read with great interest Brian Smithson's contribution to this reflector (and Rob Boux's)
and although my observations are not specifically aimed at the FT100 (I am sure someone will point this out !) I quite agree that pressure to compete in a very limited amateur radio market could be considerable. I accept that companies such as Yaesu, Kenwood, Icom etc. do not have all their eggs only in the ham radio business, as a result I wonder why it is so necessary for them to "stay on top" of this particular market. If that is indeed the case.

It is not so many years ago (I was licensed in 1961) that hams had to build everything and relied heavily on ex-government military equipment. If it didn't work correctly then we would spend hours making it so and hope that the out of band spurious emissions went unnoticed !! Now we can spend good money on commercially made kit that has spurious emissions built in. These days most amateur equipment is affordable and, as with any other consumer product we would expect them to be reasonably reliable.

The march of technology and miniaturization is not always a good thing.

As an aside, I believe that UK amateurs received their 2 metre allocation at a time when "such frequencies were unusable", according to the authorities at the time ! Now mankind uses frequencies literally from DC to light and still can't get it right.

But he has put a man on the moon. When you ask, 31 years ago !!

That's progress.

Thank you for listening,

Andrew. G3OUT

I just had to chuckle when I read the previous persons post in Canada regarding the dreaded "smoking" ft100 and the comment that it was an isolated incident. One friend of mine in Toronto who has had problems with his radio that would make that look like a cakewalk.

I personally know of at least 4 people in Toronto who have had problems when this radio doing exactly what you described, and have taken the radio back numerous times for repair. Finally the Canadian distributor (I won't mention names) gave up on the problem and started referring these problems directly to yaesu USA; at a 1-2 month turnaround time each pop.

It was rather amusing at the time as we are all on the same repeater, and it was so bad that we were starting to make jokes about installing halon in the vehicles to put up with all the smoking ft100's.

My radio went in for repair 4 times. The other people in our group have had theirs go in for repair alot more than that. We placed bets on the repeater on how long the ft100 would last this time before it died.

So, comments about this being an isolated incident are complete bullsh*t.

Now, before the flames start spewing my way;
- I have on my asbestos underwear (-:
- Every radio I own is an yaesu (except for one single 220 icom radio, and its in for repair too.

And as far as the ATAS-100 is concerned, the only way that I find that it is able to survive Canadian winters is to take the antenna apart every few months and completly clean it, void the warranty be damned.

I personally would not recommend the ft100 to my worst enemy. Well, actually maybe I would (-:

First of all, I agree with you 100%. The same is true with the reliability of most products we buy. You would think that consumers would be fed up being a testing ground for poorly designed products. And, there is proof out that we never did put a man on the moon.

I have been reading and enjoying all the "heated" comments and information provided recently on this reflector. To add my two cents worth...I have owned or currently own Yaesu: Ft2500-used no problems Ft5100-new replaced
light Ft900-used no problems Ft530-used returned/fixed no charge
Vx5r-new no problems and Ft100 that I bought
used. I purchased it after the previous owner screwed it up with no proper ground and applying improper voltage with reversed polarity etc. (idiot). I have had NO!!!! problems with it since I got it 4 months ago and love the radio. I am using it with the ATAS100 and have a 75m ham stick installed on the right rear of my explorer. I use a 12v dow key to switch between the two and having installed a 2m\440 on the roof prior to purchase of the ATAS100, use the diamond dual band also. I do understand people's frustration with defective products, as I am the worst when it comes to sending back to the factory and am keeping my fingers crossed. I will continue to buy Yaesu products after having Kenwoods, Alinco's and others. It seems like anyone you talk to who has other radios complains about service. I can honestly say that the few times I have had dealings with Yaesu they have been helpful, friendly and on one occassion not charged me for out-of-warranty repair work. Sorry some of you have not had the great service/luck I have had. 73's Hugh/KD4BCF

Trust me... in almost all cases... the automakers are COMPELLED to fix/update them. Even "voluntary" recalls... volunteered at gunpoint. There is no agency except the consumer body compelling a radio manufacturer to update radios. Except in the smoking issue, it's not a safety issue.

And yes, people from Yaesu do look at this list.

Here is what the radio is: They radio has the same autotuner as the TS-570DG 160 to 6 mtrs. Then the subband is simply a FM dual band one at a time receiver. They still added audio dsp to this part of the radio. The main reciever has IF DSP and works all modes from 160 mhz to 1.2 ghz minus 225 mhz (too bad). The radio looks very much like a Yaesu FT-847 . I think they even a have a TNC plus the Kenwood skycommand (not FCC approved). The fact you can buy it as either:
a) black box for computer control for less $ like a TEN TEC pegasus
b) with the front panel..ie the Yaesu FT-847
c) add the remote control panel like a FT-100 . I like the fact the radio is larger(no heat problems) and has a tuner built in.
Basicaly it is a very versitle Radio that will appeal to many different types of users. A guy at a Ham show from Kenwood said the radios street price will be under $2000. I know several guys into 1.2 ghz all mode and they are ready to order now.
I hope the quality control is much better than the FT-100. I know countless guys who have recieved DEAD radios out of the BOX ! plus have sent their radios back and forth to Yaesu many times. Shame on Yaesu.

Rob thinks that I pick on him every time he complains about the radio but this is not the case. I've only made two postings that were critical of his previous comments. I felt it was necessary to point out that Bob was repeatedly complaining about a bad experience he had with several FT100s which he eventually exchanged for an IC706. He has posted repeatedly (I lost count at 15 postings) about how badly he was treated by Yaesu and how we are all guinea pigs for testing a radio that Yaesu had failed to test. However, I've been in the product development arena for more than 18 years and I can assure you that no company can ship a product without testing it and survive for more than a year or two. It all comes down to the amount of testing and whether or not that testing can uncover problems that may surface at some later stages in the product's lifetime. The radios with blown VHF/UHF finals were a result of solder flux being left on the boards after assembly. My guess is that the radios tested by Yaesu were devoid of solder flux. I won't say that Yaesu is blameless for this kind of manufacturing defect, but it's not the type of problem that would be uncovered in a typical qualification test, particularly if the boards were clean at the time of testing. Another common problem with the radio was intermittent high SWR. This was a result of using copper tape with conductive adhesive to complete several grounds inside the radio that failed as the adhesive aged. We use this tape all the time for investigating RFI fixes in my company, but we would not release a product with it since it is only a temporary fix because the conductive adhesive does not remain conductive indefinitely. This should not have happened, but it did. Yaesu has found a way to fix this problem by applying grounding straps with small screws to assure that the ground remains effective.

Another bug people discuss is the 'w' coming out as a 'u' when you use the ARTS feature. How many of us actually use this feature? I'll bet that most owners can't even describe how it works. I have it on all my radios and have only used it once to test it. My radio has this bug but it is not an issue for me because my callsign does not contain a 'w'. The funny thing is that most people complaining about it don't have any 'w's' in their callsigns either.

I don't care what people post here about Yaesu but I think we need to be fair and balanced in the reporting. I welcome the opportunity to hear any comments that can help others to use their FT100s more effectively and will gladly place it in the FAQ. Most of the people on this mailing list who have purchased the FT100 have been satisfied with the radio and have not had to return it. I'm not denying that the radio has experienced problems. It most certainly has had several serious problems reported since its introduction (all of which are in the FAQ). The majority of buyers have had no problems (more than 65% have indicated that their radios have never been returned for repair and work fine). Some of us have returned the radios for

repair and gotten them back and found that they worked perfectly. A small percentage have even gotten their money back or exchanged them for other brands.

What I find appalling is that several people who have a bad history with the radio want to re-write everyone else's experience to match their own. Is this a case of misery wanting more company? If I say that I like the radio, even if yours had problems, do you need to correct my thinking so that I am as unhappy as you are?

I've worked some of my best DX with this radio while driving down the highway. When a DX station hears the word 'mobile' at the end of your call, you become important to him, not just another big gun pounding out 1500 watts with a beam. You are doing something out of the ordinary and will generally be recognized for it. I don't have a lot of time to work DX, but on my morning and evening commutes, I have worked literally around the world on this little rig with just 100 W of power and an ATAS100. To me, that is magical. What if you're tuned to 10 meters and 17 meters is open? No problem, just punch a button and wait a few seconds and you're tuned to 17. Try that with an outbacker while traveling down the highway (just don't do it if you're driving near me :-).

As for those who think that I am unfairly picking on you for complaining, consider this:

If you're complaining about a problem for which you are no longer seeking a solution, you are just whining.

> Ya! Funny how that's always the case isn't it!? Just like Lee Devlin giving me a hard time everytime I dare mention any problems with the FT-100's that I had way back when they first prematurely released them. I'm the nicest person you'd ever meet and yet I keep getting called a "whiner", "shit disturber" and a spleen-venting crazy person who probably caused my FT-100 to smoke on my desk! If anybody out there cannot think I'm justified in being a "little" up-set over having to go through what I'm now going to itemize then the heck with you! I'm pissed still to this day with Yeasu, and I feel I'm within my right to be so...period! And I also feel that my last e-mail posting to this group was in no way being a spleen-venting, whining, shit disturbing asshole like some of you have said to me in e-mailings here and to me personally! This is an open reflector for all kinds of information and talk, I'm I not justified in my two-cents worth within reason!?

>
> Here is my reasons for being a "little" upset with the FT-100 and Yeasu USA...SORRY for the length, I'll not post it again.
>
> 1) Being that I live in Canada; I have everything shipped from Burghardt's where I normally buy from because of there GREAT service. I decided to drive down to South Dakota to pick-up my new mouth-watering FT-100 when they first became available. I was NOT trying to cheat Canada Customs of any money like some of you have suggested by driving to Burghardt's, I paid both tax's if you must know. If I had ordered it and had it shipped to Winnipeg, Manitoba where I live, I would have been waiting for about three weeks or so because of Customs holding it up and so on. That's why I drove to Burghardt's...not to smuggle the radio across the boarder. Plus I wanted this fantastic new radio NOW, and it was still not yet available in Canada so I had no choice but to go south for it. To drive from Winnipeg to Burghardt's round trip takes about 12 hours worth of driving and 1200 Km on the odometer, not to mention the time off work, gas, ware and tare on the car etc.
>
> 2) After a pleasant week-end in South Dakota and FT-100 in hand, fully loaded I might add I was home and reading the whole manual over before I even turned the radio on. I installed the options which I might add had a typo in installing the filters. The AM filter had to go where the CW filter went and reverse for the CW filter. I did however catch the very little piece of added paper tucked into the manual that mentioned the typo so I did install the filters properly the first time. I installed the TCXO which was very easy to do un-like the filter install, plus the CTCSS too. I might add I'm also an electronics technician and found the filter install time consuming but not un-reasonably hard to do, at least for me. I also taught electronics for a local school for one season, so I feel I'm competent in the field and not just causing my own problems from lack of experience. Anyway after all was said and done I was ready to turn the radio on and see how she worked. So far so good...no smoke, yet. I found the receiver was pretty hot and did love the DSP menu. I did however get a lot of IMD on 2/70 and found that the att/preamp didn't work in that region (not good). So for me 2/70 was un-usable on my dualbander low gain base antenna. Six meters worked fine for a quick QSO, so on to two meters I went. Well after about five minutes of transmitting on high I started to notice my receive going down hill and ALOT of smoke coming from the back of the radio. I must add my antenna was basically flat for VSWR on 2/70 and I had been using the same antenna with no problem with an Icom radio and amp for over a year. The final PA amplifier for 2/70 going up in flames was the cause of all the smoke I found out later. It seemed the radio on two meters was drawing 22 amps for 50 watts output which was crazy...no wonder the radio burnt up! the radio was dead for receive and transmit on all bands now, but still lit-up. After calling Burghardt's for assistance they kind of felt that maybe I had done something wrong. I assure!
> !
> d them I had followed everything to a "T". Burghardt's agreed to replace the radio for another one but they wanted to install all the options

themselves just to make sure. I agreed to that and they assured me they would test it fully before I arrived to pick it up the next day.
>
> 3) Well I came and went from Burghardt's for a second time and all seemed well. burghardt's told me that Yeasu was having some troubles with the filter install and people were not being careful enough with the ribbon cables inside the radio. And that only a few came back as defective out of about fifty sold so far. When I got home I tried the radio to see how it worked and found out that Burghardt's own tech installed the filters in the wrong spots! (obviously the person didn't read the manual too good!). So no filters are working but the radio is working good otherwise. I talked on six meters for about fifteen minutes with no problems and had good reports of audio and signal in SSB mode at 100% output. So for so good except for the filter blunder which I was going to look into later myself. Off to SSB two meters for a quick test, but first FM. On FM two meters the radio still was drawing over 20 amps and I felt that was the sign of trouble...no doubt! I gave the radio a try on SSB full output and talked for around five minutes and low and behold, smoke all of a sudden again. The radio had burnt-up for a second time...same story but different radio! I must also mention that the fans were very noisy in a base/desk set-up. You would have thought that the radio was gearing up for take-off any minute!
>
> 4) Well here I'm sitting in front of yet another burnt-up FT-100 and on the phone to Burghardt's asking what I should do now. They told me that I would now have to deal with Yeasu and fight it out with them, plus they made me feel like I was causing the radio to smoke. I than called Yeasu USA in California and talked to Jeff or was it Jon Lynn the service manager for Yeasu. He told me that the radio was having some "issue's" and that he assured me my problem was an isolated incident. He also told me not to mention the problems I was having to anybody or the Internet reflectors! Now why would the service manager for Yeasu USA tell me not to talk about the problems I was having unless there was something more to just me having trouble with the two I went through...makes you kind of wonder doesn't it! I must also mention that the QST review was just released on the FT-100, and they gave it a thumbs-up. I e-mailed the editor for QST and told him all about my problems with the FT-100 over the last couple of weeks. He wasn't surprised to hear from me reguarding my situation. He and another fellow who did the testing of the radio also had there first test radio burn-up on them also and they had to get another one for testing from Yeasu. The service manager also told me to send in the radio to him in California and he would look after the problem. I felt Yeasu should pay the shipping charges to California after all I had now went through two radio's and many miles to and from Burghardt's plus my time and more money after I just spent over $3000 CDN funds and not even been able to use the radio yet for it wouldn't work long enough without burning up and I was in no mood by now to have to ship the radio at my expense from Canada to California at the tune of $125 CND shipping charges plus insurance just to have to wait two months for the radio to return to me...summer conditions on six meters was just beginning to start and I wanted a working radio NOW! I must mention that I was VERY civilized with the service man!

> !
> ager for Yeasu, but I wasn't prepared to have to send in a radio at my expense to California especially when it was 1 hour old! I felt it should have been replaced for a third time at Yeasu's expense with a pre-paid return box for the dead one. Yeasu said that was an unreasonable request and obviously didn't go for it...great customer service eh!? So I called Burghardt's back and made mention of the mix-up in filters that were not put in properly. They couldn't believe their own tech would have made such a mistake but finally agreed to one last kick at the can provided I went Icom 706G instead. So I asked why I couldn't try another Yeasu FT-100 and they said to me that they were now seeing alot of complaints about the radio and it would be best for me and them if I went the proven Icom 706 route. I agreed and now had to drive down a third time to Burghardt's and return the dead Yeasu FT-100 #2 and pick up my new Icom 706G with fully loaded options installed by them of course just to be sure. I would remind you that to ship the FT-100 radio to Burghardt's still would have cost me $125, so for the sake of time I chose to drive again and get it over with in a day.
>
> 5) The Icom IC-706G has worked flawlessly ever since and I find has way better IMD rejection than the Yeasu had while working. Plus an att/preamp that works in 2/70 and a good NB that doe's work on the "G" model. No smoke...No mirrors just what I paid for, a working radio as it should be! I must say that there was a $500 CDN difference more for the Icom, but at least the radio doe's work as advertised! I must also add that Burghardt's needs a hand of applause for being such good sports about all of this, as without them I would surly of had a real nightmare with yet a third Yeasu FT-100 at that time. They also mentioned that when Radio manufactures release products or for that matter anybody that cause problems for whatever reason, it affects everybody down the line. They also said that the FT-100 at release was one of their biggest problem radio ever for sometime. So all in all I spent a considerable amount of money, time, and frustration just to buy a radio. Now maybe you can all see why I felt I had the summer from hell with the little heart breaker - FT-100. Now some of you will be saying that I should have given Yeasu the chance to try and fix the problem. But I felt, and still do, that when you buy a new radio and it's defective right out of the box, you should be given another one...NOT have to send it in for repairs! The radio probably would have come back with other problems that I never had a chance to notice for lack of keeping it working long enough. Like the CW id'er u/w problem, CTCSS tone's that were off frequency, and other's I don't need to mention again. Not to forget the hassles of getting the ATAS working with the radio properly. As I see it there are all kinds of problems with the radio, some have them all, other's only a few, and some not at all. So how can you say there is not a Q.C. problem going on!? Just look at the FT-100D; if this was a totally up-dated radio than why are people still complaining of u/w CW Id problems still? You would have figured that Yeasu had fixed that alo!
> !
> ng time ago...no? In a nut-shell, all I'm trying to say to Yeasu is smarten-up, get with it and make dam sure the products you release are working at least 99%, and quit using the amateur community as your quality

control. If any of you who were able to last long enough to read this last part, and have question's I may not have answered than please feel free to e-mail me and ask as I probably have left something out along the way. Thanks for your time...again. :)

5114. RE POLL

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-20 02:24:00 UTC
From: fred klien
Topic: 5114 Message: 5114

Hmmm. You say 65 % don't have any problems ..that means that 35 % have had a failure. I am also in manufacturing for a large company. I can assure you we would be in serious trouble if we had 35 % of our products fail. I also think it is sad that many owners have had their radios dead out of the box. Does yaesu even test these radios? Then how about all the guys who have sent their radios back several times. This is sad. I Also think yaesu knew their were many problems but said to ship it anyway and fix the bugs as they are sent in. I heard about all the technical problems before the radio was ever released from a Manager of a large multi chain Ham store. Yes I was stupid enough to buy the radio anyways. I think that the guys who say "stop the whining" are just mad they purchased a lemon model. They may be lucky their radio has not died yet but it will. It is the law of averages. Good luck to those who are out of the warranty
How much are you charged each time you send it back out of warranty?
73's FREd. I am glad I just sold mine. You will get the most $ by selling on Ebay .

5115. The power of the poll

I have been seriously debating between the FT100D and the IC706MkIIG and after reading all the messages about failures, problems, concerns, complaints, and my personal knowledge of past experiance with Yaesu-Musan USA.... you guys have helped me to decide....

Monday I will order the IC706MkIIG....

THANKS!!!

73,
Bob

I have to take issue with this one. My FT-100D came out of the box with
intermittent HiSWR, well nearly every time I keyed it and surely it would light up when I tried to talk. Last Thursday I got it back from Yaesu and it didn't have intermittent HiSWR anymore, it had HiSWR everytime I keyed the mic on 10 meters--modulation or not. That is on 3
different antenna at 2 different shacks, all with 1.5-1 or less SWR. Phone calls to yaesu resulted in they could not guarentee what ever they did will fix it, and that the grounding straps don't always work and that unless japan sends them another fix there is nothing they can
do. BTW they used Screws to fasten the ground straps in my rig when I first sent it in.

I have paid for this rig a couple months ago and still have not had much of a chance to use it. So those contemplating buying a FT-100/D, Let the buyer beware.

Ok, I have beat this horse enough, will hold off till Yaesu sends back
my rig again. I hope I have good news to report then.

>Another common problem with the radio was

I guess I should have qualified my previous posting by referring to the informal poll (which, evidently, Fred did not read). More than 8% of the respondents never owned an FT100 so one shouldn't extrapolate as to how many units have failed. I think we should start another poll so that people don't overestimate the number of units that have failed, like Fred did. Please remember that people who are happy with a product tend not to report it to anyone, whereas people who are unhappy tend to report it to at least 10 people. (Or, in the case of this forum, to more than 750 people!)

I am trying to think of a way for us to measure with statistical significance how many people are dissatisfied with the radio.

I hope that enough people respond to a new poll to get a better idea so that there is no overlap in the responses. The current poll is flawed since it allows too many possible outcomes with overlap. I would like to suggest a new poll with a reduced set of outcomes so we can draw some meaningful conclusions.

Here is a first pass (please suggest changes to me):

My radio has never failed and I am happy with it:

My radio has failed once, was fixed by the factory, and works fine now:

My radio has failed twice, was fixed by the factory, and works fine now:

My radio failed more than once and I returned it for a refund:

Yaesu screwed me over and I am extremely unhappy about it:

(did I exclude anyone here?)

By the way, Fred, you are complaining about a problem for which you no longer need a solution since you sold your FT100, so you fit my definition of a whiner. Did you tell your buyer that you thought the FT100 was a lemon like you imply in your message? If not, how can you call yourself a ham?

Bob and the group
IMHO
You should probably reconsider your decision.
This forum was developed for the purpose of discussing the FT-100
The discussions are usually requests for help to fix problems and from
those who are not satisfied and want to complain and get sympathy.
The FT-100 is an excellent radio and the percentage of problems is
relatively small. Itt appears large here among the members of this group
because most of those who speak out have a problem.
One FACT to consider is that ICOM has the worst technical support
in the radio industry. They will not even consider replacing a DOA radio or
accessory that is OBVIOUSLY not repairable without puting it on the work
bench and trying for 2 weeks (their words) to fix it.
Yaesu has an excellent track record for repairs and very few people have a
problem with them. I am a dealer for Kenwood commercial radios but use
Yaesu almost exclusively for amateur gear because it is higher quality than
any other brand I have seen. This does not hold true for commercial gear.
I have been a dealer for Kenwood, Yaesu, Johnson, Uniden, Patriot,
Regency and Standard over the past several years. I do not actively sell
all those radios and am only a dealer for many for parts and service because
they do not have the quality I look for. Kenwood is the best commercial
radio on the market today (even though they built the worst amateur HF radio
to EVER be released to the public, the TS-440) and Yaesu is the best amateur.

Back to your comment the ICOM is an excellent quality radio but the reciever
is very inferoir to the reciever in the FT-100. The FT-100 has only 1
weakness
for me and that is the antenna tuning (or lack of it). For those who say that

lack
of CAT control is a weakness, You chould get a real base station radio such
as
an FT-920 or FT-847. The FT-100 does not compete with them it is designed for

a different purpose and CAT is not needed for mobil operation and could even
be dangerous if used while driving.
I bought a FT-100 to replace my FT-900 (in my new blazer where the old 900
control head would not fit) for the drive to Dayton this year (the
FT-900 replaced the FT-890 for almost the same reason). The FT-900
(and 890) has a better transmitter and antenna tuning system but the reciever

is not even in the class with the 100.
I like mine so well that I now have a 2nd one for my Pickup.
I did have a problem with the first one on swr indication and 440 tx power
but it was repaired and returned to me within 2 weeks with on further
problems

and the 2nd one has been perfect from the first day.

Sorry about the long comment but I dont get on the soapbox very often
but when I do I cant quit.

In the two years that the IC706 e-groups mailing list has been active, they have accumulated less than 500 messages whereas the FT100 has accumulated more than 5000 in the same period. You won't find much controversy or excitement over there.

Just don't let me catch you tuning your antenna while driving along the highway. :-)

Seriously though, the IC706 is a fine radio. I used one once and liked it.

I only hope that after you buy it that you don't get so bored that you come back to this mailing list just to badmouth the FT100 like some of the other IC706 owners feel compelled to do.

Hi Lee,
You missed one important point.

Do you own a FT-100 or did you ever buy one?
If that one isn't yes any other answers don't count.
And if you do own one what month and year was it bought?
Some of those that could participate may have never owned one. I also know some that took theirs apart and didn't put it back together correctly. That causes failure.

I purchased mine in July of 1999 and have had a fully operational radio every day since then. It has been used mobile, totally portable with battery pack, and as a base radio during a couple of contests.

My reason for buying the FT-100 was I went into an HRO store with the intent of getting a ICOM 706 MKII and they had both hooked to a coax switch box so that I could try both. I found that one could hear and the other couldn't on the same beam antenna switching between them on most bands. Now put your other mobile radios into a vehicle and start the engine. The noise blanker works on the Yaesu FT-100, that can't be said for the other mobile radios on the market.

WOW, That's what I did. I went to hro in Atlanta and sat in front of the radios for almost 2 hours. and found the 100 had a better receiver, especially on 6,2, 440 ssb.

I was amazed at how much the difference was. I even asked one of the sales men to check the radio to see if some one had been playing with it.

5122. RE: [FT100] The power of the poll

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-20 10:58:48 UTC
From: Gary Mitchelson
Topic: 5115 Message: 5122

Just had to jump in here and put my 2 cents in. I replaced my 706 (Mark I which has been back for repair too, and my 756 has been back 3 time) with a FT-100 that had an out of the box high SWR problem. It was sent back, which annoyed me because it was new, but it was turned around in just a few days. I use it with the ATAS-100 and still have the ferrite cores on the antenna leads as a extra precaution.

I liked the 706, it had some nice features such as Alpha tagging memories but had problems with the NB which works so much better in the FT-100. The main reason I bought the FT-100 over replacing the 706 with a 706G is that I had also bought a new car. The radio is remoted and where I have the head of the 100 the 706 would not fit. I really like the way the remote head of the 100 is mounted, much better than the 706 but I like the way the remote cable on the 706 mounts to the base.

Other than the size issue I am hard pressed to make a choice one way or the other. Both have fine attributes and some problems. If it were for base use I would pick the 706, if it is for a slick mobile install then the 100. Mine is mounted in such a way that it almost looks like a factory part of the car. http://n3jpu.tripod.com/Mobile.html

Subject: Re: [FT100] The power of the poll

In the two years that the IC706 e-groups mailing list has been active, they
have accumulated less than 500 messages whereas the FT100 has accumulated more than 5000 in the same period. You won't find much controversy or excitement over there.

Just don't let me catch you tuning your antenna while driving along the highway. :-)

Seriously though, the IC706 is a fine radio. I used one once and liked it.

I only hope that after you buy it that you don't get so bored that you come
back to this mailing list just to badmouth the FT100 like some of the other
IC706 owners feel compelled to do.

From: Paul R. Valko
Topic: 5064 Message: 5123

I am happy that people have a choice between radios with the 706 and FT-100.

My FT-100 went back twice when I first bought it... fixed free, shipping charges both ways paid for, quick turn around and very friendly service... even though I was REALLY P.O.'ed about it.

My HI-SWR problems went away when I properly grounded the rig and the antenna mount on the first day it was installed in my car.

At it's one-year anniversary, I also sent in back at my expense for all the latest "mods."

There probably is not too much different one way or the other with either rig. The FT-100 shines with the ATAS-100, but I do like Icom's implementation of the built in CW paddle using the UP/DOWN buttons.

My bottom-line:

After a year and a half of owning it as a mobile-only radio (and 25 years of hamming) the FT-100 is the coolest ham rig I've ever used.

To: FT100@egroups.com
Subject: Re: [FT100] RE POLL

I guess I should have qualified my previous posting by referring to the informal poll (which, evidently, Fred did not read). More than 8% of the respondents never owned an FT100 so one shouldn't extrapolate as to how many units have failed. I think we should start another poll so that people don't overestimate the number of units that have failed, like Fred did. Please remember that people who are happy with a product tend not to report it to anyone, whereas people who are unhappy tend to report it to at least 10 people. (Or, in the case of this forum, to more than 750 people!)

I am trying to think of a way for us to measure with statistical significance how many people are dissatisfied with the radio.

I hope that enough people respond to a new poll to get a better idea so that there is no overlap in the responses. The current poll is flawed since it allows too many possible outcomes with overlap. I would like to suggest a new poll with a reduced set of outcomes so we can draw some meaningful conclusions.

Here is a first pass (please suggest changes to me):

My radio has never failed and I am happy with it:

My radio has failed once, was fixed by the factory, and works fine now:

My radio has failed twice, was fixed by the factory, and works fine now:

My radio failed more than once and I returned it for a refund:

Yaesu screwed me over and I am extremely unhappy about it:

(did I exclude anyone here?)

By the way, Fred, you are complaining about a problem for which you no longer need a solution since you sold your FT100, so you fit my definition of a whiner. Did you tell your buyer that you thought the FT100 was a lemon like you imply in your message? If not, how can you call yourself a ham?

Hey guys:
I have a great idea. Let's all go over to the IC706 mail lists and complain about how crummy the 706 series is, how Icom kept baiting us to buy a new model with marginal improvements, and how rude and unresponsive Icom service has been to us. Then when they get a little sensitive about that we'll throw in some reports of how we heard of others that have had problems too so they don't think it's just one or two of us that are sour apples. For a little extra fun, we can go pump their polls full of negative data to really irritate them. Then, just when they think we've forgottem about them, we can go back and start the whole process all over again. If they start to catch on, we'll post some bad news about some of the Icom dealers giving up on support to throw them off balance. Sound like fun?
On second thought, Let's go over to the IC706 mail lists and stuff 'em full of messages on how great the FT-100 is and how Yaesu provides only perfect support. Yea, that would really irritate them.
Isn't it great how you can have so much fun with the Internet?

;)

Yea, the FT-100 is not perfect--far from it, but I like it very much, use one every day, and appreciate the support I've received from Yaesu as well as the support from most of the others on this mail list. Thanks.

Chuck - N8DNX

I enjoy the daily posts of : " my Ft-100 came back and still doesn't work" or " It finally happened, High SWR on 2 mtrs and 440 mhz..guess I;ll send it back again" , or "this is the second dead Ft-100 out of the box". Ha Ha . I'm glad I don't own one anymore.
As far as going to the Ic-706 G list. There are no problems with the radio. It has been perfected . Yes, it doesn't have some features that the FT-100 has but most importantly it has one "RELIABILITY". HA HA.
That is why there are no angry posts on that list or the Kenwood list . I will leave this list and say
HA HA Suckers. I only lost $ 110 on my FT-100. I LOVE my ICom 706mkIIG
I also can't wait for th Kenwood TS-2000 !

From: Vapor
Topic: 5127 Message: 5129

Well after buying my FT-100 and working thru the minor troubles (grounding issues with the antenna not the radio) I have grown quite attached to the little thing.

Mine has worked without incident from the day I bought it, the short time it was in the house as I became familier with the controls (not something I would try driving down the road), and into my Suburban and now in my Tracker. The current installation did require a little more grounding than it did in the 'Burb (less metal and all) but not a major life ruining ordeal as some would have you believe.

Yes I have owned the Icom 706 Series and did not find it suited my needs. The receiver was weak where I prefered to work. The NB and DSP were "tighter" on the Yaesu at least to my ear and that is all that matters. Personal preference. You can say all day long that this radio has better filtering than that radio, but unless that is evident at the ear all the measurements matter not.

I have no ill feelings towards any particular brand. I have used most major brands in my years in the hobby. So I am not out to bash any radio just to express my experiences.

But the linger question in my mind is why they continually leave the 1.25 (1.35) Meter band out of these radios. Is this a ploy to prevent activity so the FCC can move more of the spectrum to the private sector and give the manufacturers the opportunity sell more radios to the business users? [Conspiracy Mode OFF] <GRIN>

Hi all,

I read all the comments (good and bad) with interest. I like the fact everyone shares what's inside. Sometimes though some get carried away. But in any case I'm one of those happy customers. Yes, if you look back I did have a problem with mine after a few weeks, but Yaesu fixed no cost in a couple weeks. It works excellent. But, I probably don't put it through the paces as some of you. I only work a few bands and not all the buttons etc. But no problems to speak of.

Regarding HiSWR though, I do see that once and awhile. Last night on 10 boy I couldn't get much output at all and the SWR was flying high. Since I thought I read in here once about leaving the one antenna port hanging that you might run into problems. So I connected my 2/70 antenna and left it on. Guess what? Problem went away and full power on 10. Just thought I'd share that. Not that it will solve everyone's problem out there. Yes, I'm very interested in the new Kenwood coming. Have had Kenwoods for most of my 30 years in radio. Never any real problems, but hey, we are talking technology moving fast here in radio. And isn't that what we are all here about - experiment and improve. I can guarantee you the Radio companies eagerly listen to what is said here and go back to the drawing board to make a better mouse. Face it, that is how they stay in business.

From: Ham
Topic: 5132 Message: 5132

Funny...I did the same comparison at a friends' place and found the RX to be quite comparable on any ham band. In fact, I found the 706 to be hotter out of band.

Hugh VA3TO

WOW, That's what I did. I went to hro in Atlanta and sat in front of the

radios for almost 2 hours. and found the 100 had a better receiver, especially on 6,2, 440 ssb.

I was amazed at how much the difference was. I even asked one of the sales
men to check the radio to see if some one had been playing with it.

>Tom Tishken KD4WOV(laptop)" <kd4wov@...>

5133. Comparison of service

Date: 2000-10-20 15:37:43 UTC
From: Ham
Topic: 5133 Message: 5133

Personally, I'd rather deal with a product from a company that has a poor reputation for customer service *but* their product works as advertised than a product from a company that supposedly has good customer service but their product is flawed and troublesome.

BTW, you're missing the point on the FT-100 CAT. The interest isn't in being able to computer control the radio while mobile...it's in being able to use your computer to enter a frequency database and upload it to the radio. Fingerpokin and knob tweedlin to enter frequencies into the memory channels on the FT-100 is a bitch. Unfortunately, they overlooked this in the CAT capability.

Hugh VA3TO

>One FACT to consider is that ICOM has the worst technical support in the radio industry. They will not even consider replacing a DOA radio or
accessory that is OBVIOUSLY not repairable without puting it on the work

bench and trying for 2 weeks (their words) to fix it.
Yaesu has an excellent track record for repairs and very few people have a
problem with them. I am a dealer for Kenwood commercial radios but use...

>For those who say that lack of CAT control is a weakness, You chould get a real base station radio such
as an FT-920 or FT-847. The FT-100 does not compete with them it is designed for a different purpose
and CAT is not needed for mobil operation and could even be dangerous if used while driving.
I bought a FT-100 to replace my FT-900 (in my new blazer where the old 900
control head would not fit) for the drive to Dayton this year (the FT-900 replaced the FT-890 for almost the same reason). The FT-900...

Hello all,
I've been reading the reflector for a few weeks now.
I see there is alot of mixed emotions about this radio. I decided to take a chance and see how my luck goes with this rig.
I wanted to check the HF power output, put it in CW mode. I then keyed the mic with the watt meter and a well tuned ant. in line.
The radio indicated it was xmitting by the RX/TX light changing to red and the fans going on. The power/swr meter did not move. I verified the HF power adjustment on the rig was at 100%. I was able to see power in HF FM and AM modes.
I was able to use 2m and 440 with out any problems. Am I going about checking the power out the right way ? Is there something I need to change in the CW mode ?

Another question, I see posts about different mods, other than the rec/xmit mod, is there a list on a web page thay may have these mods listed?
Thanks in advance for any input guys,
Roger (N6DVZ)

Are You Using the ATAS-100

If so, I was reading My FT-847 Manual last night. It says that if you are
using the ATAS-100 Antenna, that you cannot use an SWR / Watt meter in line
as it will not allow the Antenna to function properly.
I wonder if the same is true for the FT-100

Well folks my wife and I just got back from a 6hr round trip from Rochester NY to Alex Bay NY(1000 Islands) and worked just about anything we wanted with our FT-100 and ATAS-100(pictures in the files section). We have had the radio for since Sept. 99. Has never had one problem, I do feel quilty as I did send it back for updates and tune-up before the warranty was up. Have no idea what they did and don't care as I have not had the cover off and it works. The radio was gone 8 days not bad to California. I will be retiring shortly and thinking about another one for the other car.

Great rig

Topic: 5139 Message: 5139

A few weeks ago I let a message and asked several people to tell me how they liked the FT-100 using the Atas-100. All reported that the Atas-100 was a good antenna and that they were satisfied with the antenna. For all of you that responded to my message thank you.

I have been using the Atas-100 for a couple of weeks and it works very well, however here is the problem I encountered today and it's driving me nutts. I have been using Atas-100 only, that is to say one antenna for hf/vhf, menu 61 "ATAS-1". I have discovered that it's not a great antenna for 2 meters. So, I removed the duplexer, hooked the atas-100 to the hf pigtail and hook my diamond 2 meter to the vhf side, reset menu 61 to "ATAS-2". The problem is since doing this the darn thing won't tune hf right. It will try, stop and leave me with a high swr. Then I found that by starting at 40 meters and tuning each band, not skipping any that it would sometimes tune up to ten meters. Then I discovered that the more I worked with the ATAS-2 setting and the 2 antennas the worse it tuned the atas-100, sometimes not at all.

Has anyone else had or heard of this problem ? I sure would like to run the 2 meter antenna since it has much more gain than the atas-100. Any and all suggestions would be welcome.

Thanks

James Pope - KC0DND

Roger, I'm not sure about the FT-100, but typically to achieve output in the
CW mode you must have a key pulled in to the rig and use that key. Keying
the mic will not produce RF output when you are in the CW mode.

If you use an external watt meter the FT-100 manual tells you that you have to make sure that the watt meter has a direct connection between the 'in' and 'out' jacks. See page 64 of the manual.

5143. few questions....

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-21 03:47:32 UTC
From: Sly
Topic: 5143 Message: 5143

I have a few simple questions I'm sure this list could answer.

1) What is the scan speed (of memory channels) of the ft-100?

2) I know the ft-100 has pl and dpl capabilities. Does it have some sort of search function to find an unknown tone of a repeater?

3) Does the tx mod open up the tx on either side of 6 meter band?

TIA
Sly n5gqb

5144. Chevy Tahoe mounting options

Wondering if anybody has any pictures of how/where they mounted an ft-100/Atas100 or Outbacker combo in a Chevy Tahoe. Just trying to get some ideas for myself.
Please send me a URL or pictures if you have.

Appreciate it!

From: Sly
Topic: 5145 Message: 5145

I know the 100D model hasn't been out very long so there's not as many 100D's out there as compared to 100's. Just wondering if any 100D model buyers have had any problems with their radios? Like high swr or dead out of box, etc.

I know that the 100D comes with some pre-installed accessories that are extra with the 100 model. But is that the only difference or was there some other changes made? For example many report that you had to send in (the 100) for high swr problems and Yaesu replaced the copper ground tape with ground straps, was this corrected with the 100D?

All comments welcome pos/neg, however NO bashing. (yes I'm wise to this list)

Thanks again,
Sly n5gqb

I bought my 100d back in may and I have not had any problems with the radio itself. I did have a few problems due to poor grounds at the antenna and at the radio. other than that it is a great Radio.

2 things I will say. if you want to do some serious CW get the 300 Hz filter. Or if you want to do some AM SWLing then get the 6 kHz am filter. with out the am filter your am band with is very wide..... like about 12 or 15 kHz or use the 2.4 kHz filter (which is what I do, because I have the 300 Hz CW filter). Other than that it is an awesome radio, I use mine from 160 - 70 cm on all modes. Once you get used to the dsp it really does a good job for what it is. Look at Lee's web page for info on setting it up for AM to use on 10 and 6 meters.

Don't panic, I am not about to repeat all that has gone before !

It has occurred to me that the cause of this warning icon is the fact that some
FT100's self oscillate around 13 MHz. Would it be at all possible that the swr circuitry in the PA finds this frequency "unacceptable" and brings up the icon since it out of specification ?

My 100 would bring up the icon into even a dummy load (on 12 and 10m) but since the "mod"
does not. It would be interesting to see if someone with an FT100 that can wideband transmit into a dummy load at 13MHz and recreate the fault. Then repeat the test on a ham band. This would of course require a rig that works normally anyway.

I do not recall any reference to this 13MHz versus SWR on the reflector in the past. If it has been on, sorry !!

From: Paul Chambers
Topic: 5149 Message: 5149

Hello All,

I am happy to say that most of my problems with mic adapters and digital jacks are a thing of the past....

Yaesu has made an interface to use to wire one's favorite mic to the ft100.. And through patient soldering and observation, my interface for the digital modes has been successfully completed!!

Anyone looking for the interface for the mic connection, it is called a "ct-69".. It will interface between the telephone modular style plug to a standard 8pin Yaesu mic jack.. It's up to you to wire your favorite mic with a 8pin mic plug..

Thanks to all who were of help and to those who tried to help!

Cul!

N2TIF,
Paul

Topic: 5151 Message: 5151

Hello,
I have done the SWR mod , so have that strap from connector J5014 to the ground.
The strap to J5015 was already there.
HISWR Icon is gone now on 12M and 10M , 12M is OK full power and tuning goes well but I still have a problem on 10M SWR seems to high and have only 50 watts
an external swr meter gives me a good swr.
In fact the SWR is OK but the ft-100 still sees a bad swr (---- on the meter)
So what can I do ?
Thanks in advance for your help.
best 73's
Marc

I have a Ft-100D and the answer is that it has to be sent back also for the swr mod. Works great since I have gotten it back and I am happy with the rig. The Yaesu Tech told me that from a RF standpoint the ft-100 & the FT-100d are identical.

5154. LS-400 installation

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-21 20:47:24 UTC
From: Bob Evans
Topic: 5154 Message: 5154

As you will see, I'm a terrible photographer, but I've had a couple of guys ask me how I made a dual support license plate bracket. Pictures can be found on eGroups FT-100 "Files" under "ATAS-100 on LS-400" or go directly to:

http://www.egroups.com/files/FT100/ATAS-100+on+Lexus+LS-400/

I used two $.50 galvanized shelf brackets, 2 bolt/nut sets and an 8" aluminum strip. All were purchased at Home Depot hardware store for less than $5. I matched the color of the car by painting the bracket with those tiny little brushes found on generic auto touchup paint. The LS-400 license plate has nice long metal bolts into the truck lid and the whole thing is sturdy enough to handle my 80+MPH trips between Houston and Dallas, which is a 3 1/2 hour sprint. I drilled a hole in the aluminum strip for the Comet CK-3M cable assembly. I thought this assembly (8' of RG-8X stepping down to 17" of RG-188A/U) was a good idea for less conspicuous mounting, but I had to replace the entire coax run because it caused SWR shutdown on the FT-100 for some reason. It took me forever to troubleshoot replacement of a brand new coax assembly, but everything worked great once I put RG-8X all the way from rig to antenna AND soldered the connections at both ends (which was NOT the way it came from Comet!).

The height of the antenna lets me drive into the garage, if I want, without removing it, however, I usually keep the antenna in the trunk unless I'm going to be driving for more than 30 minutes. I also don't like the idea of having a $300 antenna just begging to be unscrewed while it sits in a parking lot. I have a separate 2m/440 antenna that I mounted by drilling into the right rear car body panel. Drilling holes and mounting HF mobile antennas prove it's amazing how liberal you get with a 10 year old car. Of course, I've been thrown out of the Lexus owners association for trashing my car! (Just kidding, there really isn't an owners association; they just randomly honk at me on the streets and tell me I've got a tree branch stuck in my trunk).

Anyway, I hope someone in the group can make use of this description for their installation. Mine tunes perfectly, including the WARC bands. I look forward to catching you on mobile CW, however, I will begrudgingly stoop to SSB or FM occassionaly, too.

Bob, K5WA/m

P.S. I love the FT-100 and it has never burst into flames on me. Of course, our winters don't get too cold in Houston but the summers hit 109F and the rig has always been mounted in the trunk with no A/C

(that's Air Conditioning for you cooler climate boys).

Gongrats on passing the theory test for General.

What were you doing at the time you saw that icon? There are a LOT of
icons built into the rig that are not used in the US version. I dunno if
they are all used in the japanese version. I personally like the
"bomb" icon :-)

Gongrats on passing the theory test for General.

What were you doing at the time you saw that icon? There are a LOT of
icons built into the rig that are not used in the US version. I dunno if
they are all used in the japanese version. I personally like the
"bomb" icon :-)

5160. Update on my 817

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-21 23:19:54 UTC
From: Howard Z
Topic: 5160 Message: 5160

Sorry I haven't followed up on some of your questions pertaining to my 817 which I received from Japan . I left off where I had reset a couple of the hf parameters in order to measure maximum power capability .

I then ,at that point decided to leave the rig at 6 watts output . Since that time I received low audio reports (too much dynamic range) , I immediately suspected that by changing the power settings that the alc was affected . I then attempted to increased the ssb tx audio in the user menu settings , its default value was 50 , at 64 I became aware of a problem , the rig had no tx audio at 64(maximum value for this setting is 100) . Since the electronic level control that is used to attenuate mike level is a serial input device I assumed that Yaesu had a software bug , however since there was a lack of mike gain available to develop sufficient alc at 6 watts to make the audio punchy (remember : this radio relys heavily on alc for a full envelope as there is no DSP or pre-processing, it has no other form of processing but alc) I then , having taken note of the original values in the alignment menu , reset the 817 to the factory values . I continued to receive "thin" audio reports (too much dynamic range) .

The audio could not be turned up high enough due to this "software bug" and the only way that I could develop the alc level required for communications audio was to "mouth " the mike and speak a little louder than normal (this becomes a problem with 3 kids sleeping) . I contacted Mike at Yaesu and informed him about the bug and that the radio could never reach full tx mike gain . A few days later he received positive confirmation from Japan that there is an audio bug and Yaesu feels that it will not hinder the performance of the radio and that they will market in North America with this bug.

I disagree with their statement completely as I have hands on experience with the rig and it does not modulate sufficiently nor develop adaquate alc unless I speak close and loud .

The characteristic of the bug is as follows ,when one turns up the mike gain (ssb mike gain) past 64 the gain begins again from 0 (zero) and increments up 36 counts to digit 100 , if you compare the gain setting (with a scope) of 100 to a setting of 36 you will see that both levels are the same . I proposed an intermediate fix so that I wouldn't have to disturb my family and that is to change some resistor values on the 1st speech amp to increase the gain by approximately 6 db . I don't believe that Yaesu will impliment this change and the radio will be released with this bug as they have stated.

Aside from this I still love the radio and hope that Yaesu fixes their firmware quickly so that I can purchase a second one . I am currently working in Washington DC for the week and have worked DX (Moscow) and some

local US stations on 20 meters simply with a long wire dangling out the window of the hotel from the 8th floor . I really love the radio , just wish Yaesu would correct the problem before releasing the first version , Without opening the rig I will endevour to find a suitable replacement mike .

Just one last comment the mike gain works properly on FM and AM only ssb mike gain is affected by this bug .

73's Howard VE2AED

LAte breaking news , I arrived back in Montreal last evening from DC and connected my 817 to my 12 volt supply , went on 20 and suddenly had plumes of smoke from my 817 and then the radio was of course dead . Something in the rig had shorted out the batteries and caused a meltdown of the battery holder , fortunately the springs on the battery holder became annealed and opened up the battery circuit , had that not happened I would have probably had a fire in the radio as I am using 1.6 amp AA nicads . I immediately opened up the radio , removed the battery holder and measured 0 ohms from + to ground , same on the external DC input . I decided I ad had enough for one day since I had been out of town all week and brought the schematic to kids swimming lessons this morning . After tracing all paths only thing I could come up with was that the torroidal rf power line choke had probably shorted . When I returned home I immediately removed completely the main PCB , removed the choke and voila it was in fact shorted . I then stripped the torroid core of its 6 turns of no. 24 wire and rewound it with a higher temp enamal insulation then the original one , I think Yaesu overlooked this part of the circuit as after careful checking I observed that the melting temp of the original enamal on this choke (T35) had a very low melting temperature and to top it off there is no fuse what so ever between the internal batteries and the radio or for that matter the external connector and the radio , If this choke fails you have a disaster . I have taken a photo of the old wire and the newly installed choke and will post it tomorrow if I can find some time . I must say that removing the main PCB was very simple and I was impressed with the layout and the aluminum frame construction which is the TX heatsink as well , the rig is extremely easy to service in my opinion . I still like it very much and in no way am I trying to influence anyone here as to what choice to make , I am being purely objective and factual . The receiver sounds great and for those of you that asked there is no DSP in this radio , If in fact there were I wouldn't be so demanding about the mike gain bug which you will all probably see on the first run .

I did try an electret mike with higher output and it compensated for the lack of gain , problem was that it was originally meant for a vhf HT and had a poor shield which would cause rf feedback when I used an antenna close to the rig .

Hope this letter has been of interest to all of you .

thanks for the congrats. :)

i was tuned into 3.850 but i don't know what else to tell you.
the icon said 'off' underneath it also, but you prolly knew that.

for some reason now i can't tune any band. the atas ant stays fully
retracted. i'm stumped and getting frustrated but i'm new.

From the ATAS100 portion of the FAQ:

"The ATAS antenna is 56" fully retracted and 63.5" fully extended. A trunk lip mount like the Diamond K400 adds about 2" to the overall height. "

I find that mine hits the overhead door on the way in and out of the garage, but causes no problems. I usually keep it tuned to 10M when not in use to keep it shorter and reduce the wind load on it while driving.

From: Lee Devlin
Topic: 5139 Message: 5166

First of all, you should make sure that the radio has a factory mod which involves small metal straps and screws to ground the straps to the casting inside the radio. A picture of the mod is shown in the FAQ under the section 'Intermittent High SWR'. My radio worked much better with an extra length of coax 3 feet in length before I had the mod done. Now I find that I don't need it.

It's possible that the duplexer provided you with this extra length of coax and that's why it tuned properly. If the radio is unable to get a good tune on a band, it doesn't know which way to move to go to the next location. Once this occurs, it sometimes extends all the way and then retracts all the way and gives up and will make the next tuning process take much longer next time.

Also make sure that the radio and antenna have a good chassis grounds with short fat sections of metal braid. Some people have found that wrapping the coax feedline around ferrite donuts also helped.

From: Phil (ON4BAW)
Topic: 5167 Message: 5167

Hi,

I live on an appartement (1st floor) and whe have a balcony in the back.
I'm looking for a small but still efficient solution to work HF bans 10-20/40 meter.

Has anyone some experiance with mounting a ATAS100 on a balcony ?
How about the counterpoids ? Can u use the balcony or do u need radials ?
Would a SGC smartuner be a better solution to work HF ham bands ?

All help or info is welcome !

5168. Unbelievable!!!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-22 09:40:55 UTC
From: nrg@radiolink.net
Topic: 5168 Message: 5168

Hi everybody

I have my FT100 9E since July 99, I get most of the problems
mentioned on this reflector But now listen to this one ! .

Last winter, the squelch was not working at all, no way to shut down
the background noise, so it was impossible to use the radio on FM.
I send the radio back to Yaesu, asking them to fix the HISWR, the
channel encoder and the squelch, they was able to solve only the
encoder problem Because the other to was working OK on the
bench

This summer the squelch was working fine and since few weeks the
problem start again!

Yesterday I decide to remove the radio from my car, to send it again
to Yaesu. I put the FT on my bench, I made a quick test with my power
supply, the squelch was staying always open but the green led was
showing properly the state of the signal Few hours after I did
the
test again and the squelch was working fine! The only
difference
between both was the temperature of the radio!
So I left the radio all the night outside on my balcony, the temp was
around 10°c (50°f). I did the test again this morning and no
more
squelch So now I'm sure is a question of temperature of the
radio
But which element is guilty?

Please any suggestion will be very appreciated .

Joe,
That icon means "TX Inhibit". It indicates that the selected transmitter frequency is invalid. No RF output is possible in this condition. (That is what the chart says.) If you were trying to tune the ATAS, note that it is not made to tune on 75/80 meters, and that is your problem. Take a look at the manual.

I found the chart at http://www.onelist.com/files/FT100/ft100icn.jpg quite some time ago.

What does "prolly" mean?

Stephen,

Sacrifice a small piece of RG8 or 213. You should be able to pull
the center conductor with the dielectric out with out disturbing the
braid. Leave the outer jacket on except for an inch or so on each end.
Make your connections accordingly.

Regards,

Tony - N2KI

Yaesu makes a 'balcony' kit for the ATAS100 called the ATBK100 ($US 90), but it is only intended to work as a counterpoise for 6M, 2M, and 70cm. One owner posted that he was successful making a counterpoise for the ATAS100 with 4 sections of 1/2" braid about 20 feet long and operating from his balcony.

From: "Paul Chambers" <pfc1st@...>
Subject: Most problems over!

Hello All,

I am happy to say that most of my problems with mic adapters and digital jacks are a thing of the past....

Yaesu has made an interface to use to wire one's favorite mic to the ft100.. And through patient soldering and observation, my interface for the digital modes has been successfully completed!!

Anyone looking for the interface for the mic connection, it is called a "ct-69".. It will interface between the telephone modular style plug to a standard 8pin Yaesu mic jack.. It's up to you to wire your favorite mic with a 8pin mic plug..

Thanks to all who were of help and to those who tried to help!

Cul!

N2TIF,
Paul

hmmm.... That is interesting. here a few weeks ago it got down in the upper 20's and I did not have any squelch problems.

Do you have the face plate on the radio or remoted? also check the contacts between the two.

Subject: [FT100] Unbelievable!!!

Hi everybody

I have my FT100 9E since July 99, I get most of the problems
mentioned on this reflector But now listen to this one ! .

Last winter, the squelch was not working at all, no way to shut down
the background noise, so it was impossible to use the radio on FM.
I send the radio back to Yaesu, asking them to fix the HISWR, the
channel encoder and the squelch, they was able to solve only the
encoder problem Because the other to was working OK on the
bench

This summer the squelch was working fine and since few weeks the problem start again!

Yesterday I decide to remove the radio from my car, to send it again
to Yaesu. I put the FT on my bench, I made a quick test with my power
supply, the squelch was staying always open but the green led was
showing properly the state of the signal Few hours after I did
the
test again and the squelch was working fine! The only
difference
between both was the temperature of the radio!
So I left the radio all the night outside on my balcony, the temp was
around 10°c (50°f). I did the test again this morning and no
more
squelch So now I'm sure is a question of temperature of the
radio
But which element is guilty?

Please any suggestion will be very appreciated .

Greetings to one and all from N9YTY in Rockford, Illinois, USA.

I am the owner of a Yaesu FT-847. Being an apartment dweller for almost all of my Ham time, I never really got into the HF bands much. About two years ago or so I picked up the FT-847 and ATAS-100 antenna to do some mobile work. It does a fine job, but I didn't want to leave it sitting in the car all the time, thinking it too much of a temptation and too easy to walk off with.

I am now getting re-interested in mobile HF, and am thinking about the FT-100D for a permanent installation. I'm just wondering if some of you could perhaps send your thoughts, comments, experiences, etc to me in private e-mail so I can help make my decision.

Any particular places selling it in the states these days that has a "good deal" on it? I see the FT-100 is going for as little as $900, but is it any "savings" as compared to buy the FT-100D given the improvements?

Thanks to one and all for your help.

If you only want to go mobile with it, then you won't need the CW filter, and most likely you will use an external speaker, so I would go for the plain vanilla FT-100. Just make sure it has had all the mods done or send it back to Yaesu for them to do it.
At $900 it's a steal !!
I have one in my Chevy Pick-Up, use it with a Hustler om HF/6 and a Duo-Band on 144/450, it works great. I have worked VU, CE9, FO0, 9V from W1 land while "mobile-in-motion".

I may be asking the obvious question, but did you guys try this test with the car running? The cold battery voltage without the benefit of the alternator charging it will be low.

If you have the radio on the bench, you can try lowering the voltage to see if this causes the squelch problem. It's not very likely, but at the very least you ruled out one possibility.

Joe,
That icon means "TX Inhibit". It indicates that the selected transmitter
frequency is invalid. No RF output is possible in this condition. (That
is what the chart says.) If you were trying to tune the ATAS, note that
it is not made to tune on 75/80 meters, and that is your problem. Take a
look at the manual.

I found the chart at http://www.onelist.com/files/FT100/ft100icn.jpg
quite some time ago.

What does "prolly" mean?

Joe,
Check voltage at the radio. If it drops to or below 13 volts the antenna will not move at all. You will also find that you have low RX and low tx pwr out. A buddy of mine has experienced this very problem. Keep the vehicle running and try again. Also, the ATAS 100 will not tune 80 mtrs and Yaesu does not garuntee 40 mtrs either.

Lee,

On your FAQ the photo of the factory mod shows a strap not only to the V/U connector but also to an area of metal shielding/screening outside the PA section. I had not noticed this before. What is the shielding shielding :-) and is this extra strap vital to the success of the mod ?

Yaesu UK did not fit any additional straps during my Ft100 return visit. The HF connector strap was already there. (mine is a 9J series, bought April 2000) I have added the other strap using a spring steel clip to the centre casting and matters are much better. Is there any benefit to be had by adding the shielding strap or should I stick with "if it aint broke, don't fix it" !

I would prefer to drill and tap the
casting but daren't ! (still awaiting advice on that one......thanks Bob G8IYK !)
Would it be possible to adapt the tapped hole for the top centre case screw or is this too far away from the connectors ?

Andrew.

I was going to sell my FT 100 but now I have decided to go ahead and install it in my car.
I have used it at home and it seems fine but I have read here that certain mods are needed. What are those for and does Yaseau perform those mods no questions asked?
Thanks,

Hi Phil!

I travel a lot so I wanted a similar solution.

What I'm currently experimenting with is a B&W AP-10 - it
is a telescoping vertical on a loop with an adjustable tap
and counterpoise. I also use LDG's MP10 antenna tuner. Both
work pretty well but they end up being quite a bit to lug
around!

> > > kc8pbn / ag hehehe >>

The reason for the TX inhibit Icon is that you didnt upgrade your radio
when you upgrade to general, the FT100 "knows" when you arent allowed to work
bands you are not qualified for.. You must go into the menu and adjust the
settings to "General and Above" or answer 3 random General ticket questions
which pop up on the display using the A,B,C,D buttons across the front..
Anyway, thats a lie.. Try a ferrite core around the coax (5 turns) until you
get a chance to have it modded by Yaesu.. Good Luck and I hope to hear you
on the bands... Richy KB2CPW

One nite while driving with my ft-100 and atas antenna tuned on 30 meters, down in the Monterey, CA area, I made a contact with south africa 579 both ways.

The key to success is the mounting of the antenna. Needs to be extremely well grounded. Helps to have the coil above the roof line but not absolutely necessary.

Gordon in CA

>If tyhis has already been answered sorry, been lurking a while must have
>missed it.

It works for me on all bands (40 and up) running with an FT-847.

I have it mounted "sort of" strangely. I have a 1994 Honda Civic hatchback,
and I had put two NMO connectors in the roof. I slap the ATAS-100 on top
of the car with a three-magnet mount, and attach a short piece of coax to
the NMO mount in the roof. This, for all intents and purposes, seems to
provide the antenna with a decent enough ground connection to the car body.

I have no problem in tuning on 40, 30, 20, 17, 15, 12, or 10, and I get
decent enough signal reports, even on 40 although I don't do a lot on there.
I was living in Michigan for a while, and had a regular sched back to
Wisconsin, but that's hardly "stretching" things. ;-)

I'm about to make the leap to the FT-100 for the car, and hope it likes
the ATAS-100 as much as the FT-847 did, although I've heard they can be
a bit more picky about grounding/etc, or maybe not, I don't know. ;-)

5203. FT-100 and Auto ATU

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-23 22:00:35 UTC
From: Demetre Valaris
Topic: 5203 Message: 5203

Dear all,

I am the happy owner of an FT-100. I have this rig for over a year now and it has presented no problems whatsoever (touch wood).

I have an automatic Antenna Coupler that I would like to use in my car along with a 40 meter continuously loaded helical whip from PRO-AM hooked on the roof rack of my CITROEN-ZX. So I would like to use this Auto Antenna Coupler along with this mobile aerial in order to tune it from 80 - 10 meters.

Now the question is, how can I connect this tuner (it is made in Greece) and it needs 5 - 25 watts power to tune and it has an external interface with a button that needs to be pressed until a LED goes out when it has tuned. I have used this nice Auto Antenna Coupler Unit with my FT-1000MP for a year now and it tunes a 17 metre long wire to all Ham Frequencies. I have used it along with a homemade external keyboard of the FT-1000MP and I have wired the TUNE button of the external keyboard to the TUNE press button of the AUTO ATU. I have replaced this button of the Auto ATU with a double PUSH BUTTON and I have wired the TUNE position of the external keyboard of the FT1000MP to the second part of this double switch. The other part replaced the single switch of the interface of the Auto ATU. This works perfect.

Now is there a way to wire a similar thing to the FT-100 ??? Perhaps on the DATA or CONTROL plugs or maybe at the ALC plug at the back of the FT-100??? I need a connection at the back of the FT-100 that when shorted (or maybe when opened) it will produce a carrier in order to tune my Auto ATU. Preferably with a power of 5 - 25 watts.

Has anybody tackled a similar problem before?

Please help.

I went to this website to see the antenna.
How do you adjust the antenna ? Is it done by tuner or in the antenna ?
And does the antenna still perform well considdering the small size ?

Thanks for the answer...

Actualy I get the problem with the front panel directly mounted or connected
via the cable is the same story, also playing with the power supply voltage is
the same...

Still try to find the solution

There is a wing nut on a fingerstock collar to adjust it with. You move the whole upper section. This will then short out the right number of turns. I also use a tuner for the fine adjustments. It does perform well, better with more radials of course. I will have a better evaluation after cqww from a balcony in Honolulu this next weekend. There is a limit on the amount of weight that you can put on the top of it for the rod, since it is all supported by the collar's grip to the coil. He uses it on the road with the light whip he sells for mobile operation. The normal upper rod is sections of gun cleaning rod, very clever.

Hi Group!

At my second qth i'am using a FT-100 with an Outbacker 8 mobile antenna on
the balcony.
It performs very well...
Only thing is that you have to go outside to change the bands. :-((

Hi All, I purchased the FT100 about 4 weeks ago, put the anttena on a boot mount and had lots of trouble with Hi SWR, moved the mount on to a solid fixing point made for a roof rack and hey presto no more problems..(Volvo S70)

Last week I bought the ATAS-100 put it on this same mount and it works GREAT all bands from 6 to 40Mts no problems.. it seems all you need is a GOOD mounting point with a proper earth connection, since doing this I have had no problems at all. Get rid on your boot mounts drill a hole if you need to and you will be rewarded with a trouble free installation.

A bit sick of all the knocking of this setup it seems like you all create the problems for your-selves Hi Hi..

Cheers 73's

5213. ct-69 mic adapter

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-24 20:22:14 UTC
From: Paul Chambers
Topic: 5213 Message: 5213

Hello Group,

I received my ct-69 mic adapter for the ft100 a couple of days ago.. Today I went to Radio Shack and purchase thier 8 pin mic plug, and hurried home to do my wiring job for my favorite desk mic.

Now this mic of mine is not real fancy, and of course it is as cheap as can be...But none the less, it is my favorite!

So now I am very happy that I have my favorite mic (Turner Super Side-Kick) on my radio desk and back in business!

Thanks to all who helped or tried to help.. A special thanks goes out to my freind Aki (JA9SCB)who sent me a very clear plan for wiring the mic to the adapter...73!

P.S. The cost of the ct-69 is 29.25 + shipping (bottom line=$34 from Millwauke to Buffalo, NY)

N2TIF,
Paul

What is the proper way to connect digipan with the ct-39 cable?
I followed the digipan help instructions however the rx/tx is
reversed, to tx I need to toggle on rx, then when I go back
to recieve/tx the display stops. every works great but the ptt.
Thank to all Dave H

I have been trying to put more useful information in the FAQ about working with PSK and soundcard programs. I haven't used Digipan, but I looked at the help file and the first problem I see is that it recommends a 40 dB attenuator in the microphone input line. This may be fine for taking the signal into a mic input, but the input on the DATA port is looking for around 30mV of signal so 40 dB might be a little too much attenuation for the output of a soundcard.

On the soundcard input, I've had better luck going into the 'mic in' rather than the 'line in' and that does require some signal attenuation. The output of the FT100 is on the order of 300 mV so a 100:1 attenuator should work if you go into the soundcard's mic input (assuming the line input doesn't work or may not exist on certain soundcards). For best results, a potentiometer should be used until the settings are correct. Then you can measure the relative resistance of each leg of the pot and substitute fixed resistors if desired. You can use the slider controls on the soundcard in the control panel, but that is a pain if you have to keep resetting them for other applications so that's why it's useful to have external adjusments for the interface. It's kind of difficult to know if you have the soundcard output adjusted correctly, within a few QSOs, someone will certainly tell you if 'your're too wide on the waterfall'.

If anyone else would like to contribute to this part of the FAQ, it seems to be an area where people have been having problems.

To answer the original question, the DATA port looks like this:

Pin 1: Data In (AFSK input for soundcard)
Pin 2: GND
Pin 3: PTT
Pin 4: 9600 Baud out
Pin 5: 1200 Baud out (audio out for soundcard)
Pin 6: Squelch

So, the soundcard audio out should connect to Pin1, soundcard in (or soundcard mic with attentuator) should connect to pin 5. Ground should be connected to pin 2 and the PTT should be operated from RTS or DTR signals on the serial port using a transistor to change to appropriate voltage level (also shown in the help file).

I'm considdering using the FT100 with a SCG-237 from Smarttuner.
Suppose I use a fiber stick 21 feet long (for fishing) and put a straight wire next to it, I'll have a 21 feet vertical tuned by the SGC.

Question : What will happen when I make turns (no to close but rather separated) around the fiber stick so that I maybe get to 25 or 30 feet. This would be a kind of helical wounded wire ...

Will I have a longer wire to tune (with more gain on the lower bands because of the longer antenna wire) or will it loose performence (coupling?)

All info is welcome !

Care to publish the connections accomplished by the adapter? Or is there some active electronics inside?

For example, looking into the mic socket from outside, with the finger sticking UP (or down), first pin on the left goes to 8-pin socket pin #5... etc. Thanks

Vern ,W6mma, the guy with Superantennas.com makes a 20ft fishing pole vertical with a loading coil like you describe as a "St. Louis vertical". I have not seen it in person, but the pictures look like it is loosely wound. you would theoretically lose bandwidth because of the loading, but a slow helical is not much loading. experiment, that is what we do best, and find out.\KT7G

It seems to me I once saw a plan for a vertical antenna made by taking a 10 foot piece of pvc pipe (1/2 or 3/4 inch) and wrapping it with that metalic tape that is used on window glass in burglar alarms. It's available at Radio Shack. As I remember it, the helical antenna thus formed could be tuned to any HF band with a standard MFJ tuner. I suspect the SCG-237 could tune it as well or better. Might be worth trying. I bet the parts wouldn't cost 10 bucks to try it! I'm also very interested in the SCG tuners and mobile operation so I would be interested in what you end up doing.

5220. Re: Mic audio in and ptt connections

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-25 21:26:45 UTC
From: vk3kcj@hotmail.com
Topic: 4997 Message: 5220

and the answer is ... there are a few diagrams in the files section,
however

if you ground sw1 via a 27K resistor it will TX, there are other
values used on this line for the up and down etc. The mic in does not
have any dc on it so it will not directly drive an electret. If this
was a requirement you need additional circuitry using the 9 volt line
from the socket perhaps.

Hi there, I'm trying to hook up a headset witht mike and earphones, I have bought the CT-69 unit and wired the eight pin plug.

This set up willkey and drive my Ft1000MP, when I hook it up to the FT100 ity will go into TX but I don't get any drive from the mic!!

Anyone had this problem and know how to fix it please??

The head set has an electret mic insert and I've put the live to it but it still don't work..

Cheers all, thanks for reading this hope some one can help..

Hi there Paul, I'm in the same boat as you although I have bought the CT-69 adapter my MD100 will now plug straight in and work, following the MP's wiring so it's the same as the MD100 I tried to make my own headset, it will go to TX now but I don't get any drive from the mic!! Yet the same set up will plug into my 1000MP and drive it OK..

IT'S DRIVING ME CRAZY!!!!!!!!!!!!

Let me know if you find solution..

Cheers

Topic: 5216 Message: 5224

I had a Kenwood TS50 before and used it in combination with the AT300 (same kind of tuner).
In DL (Germany) I bought a 30 ft fiber pipe from a ham that fabricate's this specially for this use.
On static mobil operation (fieldday's or camping) I used this pole and placed it 3 feet from the car (1 feet metal pin for ground ankering) and had a 27 feet vertical tuned by the AT300 with the car as counterpoids.

I did DX with almost every region on 15/17/20/40 with it. On 80 it was good but a full dipole at 1/2 wave above the ground will perform better in my opinion ... Even on 160 I made european contacts. Not many 10/12 QSO due to limited propagation. This was a really good solution for a very fast installation (your station is up in minutes) and all band coverage. When driving I reduced the lenght to about 10 feet with still amazing results.

Now I want to use the same setup on my balcony (restricted antenna probs) but want to use a wounded coils to gain more antenna lenght. Talking to local people on VHF, we also discussed the problem and it seems that making a 'centre' coil somewhere in the middle of the antenna would be best (Q factor and loading).

Because the experiments costs only a few bucks to rewind the antenna, I will do some experiments on not-based-center loaded verticals tuned by such a tuner ...

The FC20 has a very limited matching range compared to other tuners....you are better off with the LDG AT-11....plus it will auto tune any transmitter up to 150 watts out, while the FC20 only works with the FT847 and FT100....Dale

5228. TUNe function

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-27 03:43:45 UTC
From: Steven M. Palm
Topic: 5226 Message: 5228

I thought from the description that the mike had programmable buttons.

All I can find reference to is the fact that you can choose from four pre-selected groups of functions for the buttons. I was thinking that I could program them all to do what I want like I can do with my Kenwood TM-742A.

Anyway...

My main gripe is that the one function I would use probably most often, TUNE, is not "quickly" accessible. It's buried in the menu system, and although not terrible to get to, it'd be nice to have it always there.

How does everyone else deal with this? Is it just an issue for me?

well I just change to am, and let it tune if I need to. one thing I found with the FC-20 is if you tune it at the top of the band and then at the bottom it will pre-tune itself across the band with out having to retune.

5230. Tune Button

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-27 10:52:05 UTC
From: Demetre Valaris
Topic: 5230 Message: 5230

Hi again,

Is there a way to have the TUNE button of the FT-100 produce
10 watts output but without using the ATAS antenna?

I need to connect an AUTO Antenna coupler, similar to an LDG,
to my 40 meter helical ProAM whip on the roof rack of my car.
As far as I know the FC-20 or an LDG AT-100 Auto Antenna
couplers can tune any signal up 150 watts or so.
My Auto Antenna Coupler needs 5 - 25 watts to AUTO TUNE
hence the need for a lower than maximum TUNE POWER.

Has anybody done something similar.

Any help would be much appreciated.

1. Put the rig in AM mode.

2. Press the microphone button.

3. Don't talk.

You might want to fiddle with the Power Output setting in the menu system.

5232. Automatic tuning of magnetic loop with FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-27 11:56:37 UTC
From: Ignacy Misztal
Topic: 5232 Message: 5232

FT-100 can be automatically tune very efficient yet small antenna for 10-20m or 20-40m

One of the most efficient antennas at low heights is magnetic loop. A 3 feet loop 6 feet up can have as high efficiency as a 2 x 17 ft dipole 20 ft up in the air. With a capacitor, it can operate from 10 to 20m continuously with low SWR. Its disadvantage is very narrow bandwidth so it adjustment is required every 20-100 KHz.

With FT-100, one can use the ATAS setting so that the loop can be tuned automatically with the press of the TUN button. If one has a loop that is already remotely tuned, one only needs to put limits on the capacitor to rotate 180 degrees instead of 360 degrees, and add a $10 controller.

Did anybody think about it? I have a loop that cost me $20 from surplus components. Its capacitor is hand tuned. I thought about using the ATAS settings for automatic tuning but cannot find a motor with low RPM and large torque. Anybody has any idea about how to get one?

Ignacy, NO9E

Steve...

Buried?!?! So any of the four functions that are not immdiately on the function display is buried? I typically operate with the tune function menu as the one on my display.

It would be cool to assign that function to a button on the microphone though!

I am kind of bugged that the ink on the buttons is not molded into the actual button, it's just paint and wears off after about a year. The FUNC button is the first to go.

I'm already on my second front panel and will probably have to order another as a spare and one to put on when I try to sell the rig - if ever.

I have connected my sound card and serial port to the CT-39 cable as is suggested in this e-mail for use as a PSK31 interface. I used a simple transistor switch arrangement built into a DB9 connector using the DTR as my PTT. I used the line in and speaker output for the data on the sound card. I followed the help menu instructions on adjusting the sound card record and audio out levels using a power meter and a dummy load. Voila! I was receiving reports of minimal IMD. I also use this same arrangement for packet and APRS. I use a software package called AGW Packet Engine for this.

5236. ATAS-100 stopped - any suggestions ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-27 15:37:31 UTC
From: Eric Dobrowansky
Topic: 5236 Message: 5236

Good Morning,

While mobiling last evening and working 20m DX, I decided to QSY to 10m, when the antenna decided not to automatically tune for resonance after a few attempts of the tune button. This had happened in the past, but manual tuning using the band up/down buttons usually solved the problem. However, now it appears that the antenna is stuck in it's extended (40m) position, and neither automatic (one-push of the tune button) or manual (up/down buttons) tuning will make the antenna move! It appears that either the motor quit or the antenna is mechanically stuck. While parked, I can not hear or see any movement what so ever.

Any ideas ? I thought that I had here that others had similar experiences, and I was curious as to their findings.

First three trips back to Yaesu for the FT100, now the antenna saga begins !

Thanks & 73
Eric

paul,

seems i heard s.one mention a possible sol'n to your problem on another group. if i remember right, they said to use clear nail polish over the buttons/other areas where the paint could wear off.

don't know if it works or if there are any negative side-effects to this (ie, polish reacting chemically w/the paint, etc...). if it works, you might need to periodically re-apply the nail polish, but it would be better/cheaper than paying annual tributes ($$$) to yaesu.

5242. head unit and sunlight ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-27 20:02:31 UTC
From: Steven Palm
Topic: 5226 Message: 5242

How do you all deal with mounting of the head unit so as to avoid too much direct sunlight? I have heard MANY bad things about LCD's when they get too much light/heat. Is the FT-100 protected at all against this, or does the face plate need to be removed or covered to prevent the sun from cooking it through the windows?

I don't believe the list will support attachments. Most
picture files are posted to the files archive at
egroups/ft100.

I have the FC 20/ft100.
They are currently both going back for repair.
But when they were working, the tuner worked OK;
Plusses;
You can tune from the radio with a push of a button, (if you get
another brand, you will have to go to AM and reduce power everytime
you want to tune.)
It will tune 6meters (a lot of autotuners won't).
It has a second antenna port you can select with a pushbutton on ITS front
panel (a pain it you mount the tuner out of reach though).
Minuses;
It will only tune about 3:1 or better antenna, (which is fine if you use the
proper
antenna as you should) .
It is VERY SLOW compared to the way my ICOM AH2 tunes (can take 25 seconds
vs 5max).
It wouldn't tune 10 meters (unk why).
It quit tuning six meters (and is going in for repair).
SO, it all depends on what you want the autotuner to do.....Keith WE6R

I don't think egroups allows attached files to go thru. You may have
to post it to the files area for people (including me since I am also
interested) to look at.

If you don't know how to put something into the files area, then you
can send it to me as an attached file and I'll post it in there.

I had almost the same problem of it not tuning 17, 12, or 10 meters. The problem I had was due to not having a good rf ground at the antenna. once I installed a large braided ground strap to the frame it worked fine.

I spoke with Chip Margelli last weekend at Pacificon and he
indicated there are no plans to have a computer interface to
program the memories. Of course I told him that view is pretty
short-sighted on Yaesu's part. Like it really matters to them, they
already have my money. At least the FT-817 is suppose to be computer
programmable.

I purchased the RIGBlaster to run with my FT-100 and found out that the "Blaster" folk don't have an adapter cable to mate the 8 pin Yaesu to RJ-22 used in the FT-100. I found that the Heil Sound folk (makers of those great boom mike headsets) had an adapter for about 25 dollars. I ordered one and was running PSK31 within 15 minutes after receiving the adapter. I will be taking the FT-100 and RIGBlaster along with me on a trip to VK next week. Looking forward to working some of you on PSK31 sometime in the next 3 weeks.

Larry,
Is the adapter you are using with the Rigblaster the one with the yellow colorcode next to the 8 pin end? That is what I am using to connect the Heil Pro headset to the FT100. Nice to know that the same adapter can also be used for PSK31 and the Rigblaster, if that is the case.

No plans for an improved computer interface ? That's dissapointing news. Like you say, I guess they've got our money and we bought it as is.

I was at a local hamfest in Toronto yesterday and a group of us were discussing how much of a lemon the FT-100
has turned out to be. Let's hope the FT-817 designers have learned from

the FT-100 work-in-progress.

The recently-introduced CT69 (U.S. $30) is intended to do just that, adapt the 8 pin standard mic connector to the RJ11 6-pin telephone-type jack on the FT100 and other newer radios. This is covered in the FT100 FAQ at:

http://members.home.net/k0lee/ft100faq.html#mic2

Prior to that, the Heil adapter was the only way to do this and in some cases did not work with all microphones so Bill Clarke came up with a mod to the adapter where pins 5 and 7 are shorted together.

5261. More on PSK interfacing

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-29 15:30:28 UTC
From: Lee Devlin
Topic: 5261 Message: 5261

Thanks to Jon, WA2NKF, we now have a diagram for soundcard interfacing the soundcard to the FT100 in the FAQ. Please see http://members.home.net/k0lee/pskft100.htm for more details.

The best part about this interface is that it is very simple. It is based on the CT-39 cable ($10) and has about $5 worth of other parts in it. You can probably fit all the components in the shell of the DB9 (or DB25) serial connector for the PTT. The audio in and out run straight through from the soundcard to the radio so there are no transformers or any components in that path.

I do recommend using the CT39 cable, but on my FT847 I have actually used a cable cut from a non-functioning PS2 keyboard (a PS2 mouse will work too) which has 6-pin mini-DIN connector on the end of it. The only caveat is that pin 2 on the PS2 cable (which is the ground on the FT100) is generally not wired. Instead, you can use the shield (non-insulated wire) to complete the ground through the mini-DIN shell. It works fine for me on my FT847 packet interface.

As for those of you considering the Rigblaster, remember that it costs $90 and you'll need a $30 adapter cable to connect it to the mic input. I don't like the idea of using the mic input for data when the radio has a data connector already available on the back. You have to disconnect and reconnect your mic everytime you want to switch back and forth from PSK to voice. I think that the reason that PSK interface manufacturers like to use the mic connector for input is because it's the lowest common denominator on radios and fairly consistent across a brand so they don't need to have as many options.

5263. grounding

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-29 18:00:59 UTC
From: kc8pbn@mediaone.net
Topic: 206 Message: 5263

i'm trying to use the ft-100 with the atas antenna for a base
station. (i don't have a vehicle worthy of a permanent install yet)
so i plan on mounting the antenna to my chimney. nbd.
my question is, will it need both electrical and rf ground or just
some sort of rf ground plane system?

right now i have a very rudimentary install. the antenna is mouinted
in a bush in the back yard. i have 1 piece of coax, 15 feet too
long. the radio and power supply sit on the bench in my garage. as
it sits ther antenna won't tune. auto or manually. i'm thinkin it
needs a more stable and permanant install, with proper grounding and
all. i'm just not sure how to accomplish this, being my first radio.

thanks again,

From: w5exp@swbell.net
Topic: 5266 Message: 5266

I have the above Amp that could be used for Mobile or Home station. Itis surplus to my needs. Little car to small to fit it. Never installed only took out of box and reviewed material. Original condition never put on the air. Any one interested? It would work great for FT-100 or other 100 watt radio. $700.00 shipped in US.

Unfortunately no. The Kenwood rep said they couldn't get it for
this show.

If you go to the kenwood.net site, they have a spot for you to enter your email address and I guess they will spam you regarding the unit.

My understanding is the unit will be pretty big, so this will be useful only with a remote control head in a vehicle.

Just got a used (8 mo old) FT100 and ATAS. I put them in my van and all is well except I have the 10 meter swr problem. I can not get it to xmit at all on 10 meters. I know this is a known problem but I don't have the time to send it into Yaesu. I am a EE so no problems doing the mod myself if someone can point me to a good detailed source for the mods.

Thanks,
Mark

heil sells an adapter from the eight pin normal mic connection to the FT100 rj45 type connector. This would give you an eight pin female on a cord to wire to. They have a web page, I think I got there through W7MD..

Subject: [FT100] Wiring a Mobile headset ???

Hi there, I'm trying to hook up a headset witht mike and earphones, I have bought the CT-69 unit and wired the eight pin plug.

This set up willkey and drive my Ft1000MP, when I hook it up to the FT100 ity will go into TX but I don't get any drive from the mic!!

Anyone had this problem and know how to fix it please??

The head set has an electret mic insert and I've put the live to it but it still don't work..

Cheers all, thanks for reading this hope some one can help..

5272. What are the different diodes for?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-30 14:16:12 UTC
From: oz5adx@hotmail.com
Topic: 5272 Message: 5272

In several "mods" four diodes in the front panel are shown. Very well, I can see (read) what the two left hand diodes are used for in the describtion af the mod. But I can't find any explenation for the rest of them.

Does anybody have info on this subject?

Does the service manual cover this?

I would like to do an "out of band" mod in the HF-bands, but not in VHF/UHF. This might be possible, but.....?

kind regards
OZ5ADX - Henrik

By the way:
My FT100D - serial 9K12xxxx has been working FB for abt. 4 weeks now.
Hope it'l continue that way.

Okay, I have to ask....

Exactly WHY is the FT-100 a lemon?

Having been an FT-847 owner since it came out (one of the intial adopters), and having just purchased the FT-100 a week ago, I've been quite happy with it for it's intended purpose (at least MY intended purpose for it).

I'm just curious why you and your friends in the discussion consider it to be a lemon.

Thanks for your insight.

Steven:
I think people refer to the FT-100 as a lemon because it's one of the first Ham radios to be victimized by an overexposure of a relatively small number of legitimate complaintants on the Internet.
Admittedly, the FT-100 is not without faults, however, the overwhelming majority of owners who've cooperated with Yaesu support have few problems and love their radio. Only in a few cases have people had repeated problems that seemed to be unresolvable.
Certainly any radio from any manufacturer will have some people that seem to repeatedly get lemons or for some reason can't succesfully integrate the radio into their installation. The difference here is that some of those who've experienced that frustration are exploiting the Internet to make it appear that the FT-100 is plagued with a miriad of unresolvable problems. Worse yet, non-owners who hear that, pass it on, generally with little knowledge of the actual status of the radio.
It's really the equivalent of having one owner of a piece of equipment that has problems getting on a local repeater every day or so and complaining about how awfull the radio and support is. Before long, people who hear that are telling others that they've heard bad things about that radio, despite the numerous other users in the area who may be very happy with the same model. Ever hear that happen?
I also suspect that there are others who would prefer to give Yaesu a bad name, for whatever reason. So, the short of it is, as usual, that you need to understand more about human nature than anything else to see through all the BS on the Internet!

Chuck, I really feal that you are really trying to sweep this one under the carpet and discredit the many who have gotten lemons. I own a FT-847 and read about it on forums and no one I have heard has had major repeated troubles with it, So when I purchased the FT-100D some 2 and half months ago and it is back at Yaesu 2nd time(still there as I write) for the same problem, I consider that a lemon. This should have been dealt with early on by Yaesu and with a reliable fix(HiSWR). There should be no reason to buy a rig and have to immediatly send them in for mods because they dont operate as stated, period, especiallysince this rig has been on the market for a time and in its second generation.

Steve, it is a lemon because of the above listed items. the first time I sent it in for several flaws, the second time was because it wont transmit SSB on 10 and unreliable thru 17meters, one of the issues I sent it originally for, and this is the FT-100D. You really takeyour chances on this one, expect to send it in at least once and if it operates like it should, consider yourself lucky.

Al

From: Duffer
Topic: 5276 Message: 5276

To be honest with you, the preliminary sales flyer that I have does not indicate any designation to a model number but I have been hearing "TS-2000 and TSM-2000". It very well could be TS-670 however, I thought there was an older TS-670 rig from Kenwood.

I was talking to a Kenwood rep at a local hamest on the weekend and he said that they're reluctant to be too forthcoming with details that still aren't final...like release date, steet price etc. I notice that they're not going nuts with pre-marketing
this beast. Even the preliminary sales flyer is just a wish list feature overview and a pix of a prototype...no promised specifications that can't be met are shown :) It looks like they don't want to make the same mistake that Yahoo (Yaesu) made with the FT-100.

Al:
My dad always used to say...

"It's not bad food, it just doesn't taste good to you."

While you may think the radio you received is a lemon, that fact alone doesn't make the entire model run a lemon. Many of us are very happy with our FT-100's, and in my case, both of my FT-100's. So, if you're unhappy with YOUR radio, that's fine, perhaps YOU got a lemon (perhaps not). Don't extrapolate anything more from that experience.

Topic: 5276 Message: 5278

Accordingly with Kenwood's own advertising, QST, CQ, etc., magazines,
it's been called the TS-2000. I have seen it at Dayton and it will come
in 2 versions, desktop and mobile, the ads show the "desktop" model, the
"mobile" looks like the TMD-700, but same size as the desktop, (no face)
with the remote faceplate unit like the D-700. Don't know anything about
the "670", nothing on the Kenwood site about it.
Hope this helps,
73,
Charlie n1fnr..........

Guess I am one of the lucky ones. I have had mine for over a year and use it every day mobil with the ATAS ant . and have had not one problem with it. I am very happy with it. If you get a lemon then make lemonaid. I have a FT 847 that has went back to Yaesu twice and still I am very happy with it. I will be getting a FT 817 soon . Maybe I should get a Lotto ticket tonight...

check out the poll of 178 only 72 indicated that there radio had never broke which leaves over 100 people who have had problems.
Your own poll seems to indicate that the FT100 is a lemon!

It seems that any radio could be called a lemon by some standards I've seen
applied here.

Actually, its 106 out of the sample size(178), about a 40% or so of the
radios have had problems. If it was a car, the FTC would have it recalled.

5290. Lemons and other problems

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 01:48:59 UTC
From: John Simmons
Topic: 5290 Message: 5290

Point 1: We all know that Yeasu monitors this list.
Point 2: Some of us have had problems with the radio failing.
Point 3: If the people that have had problems set back and say or do nothing then Yeasu has won. They have our hard earned money and have gotten by with producing a defective product. The people that have not had problems have a vested intrest is getting Yeasu to own up to and fix the design problems with there products. It may be your turn next time!
Point 4: Yeasu has had problems with other products over the years the FT-101 for example (it took about 3 or 4 different models to get it right) . Others have pointed out problems with other Yeasu products. When over 25% of the people responding to the survey have had problems with the FT-100 then it is time to call a Lemon a Lemon.
I am sure I will see a bunch of messages saying " I have never had a problem with my radio" That is not the point there are a lot of FT-100's out there that have had problems and Yeasu has failed to change the design and fix the D model. 100% of the people that I know personally that have FT-100's have had to send them back for repair. For my part I will not purchase any other Yeasu products.
Point 6: I have purchased and used Heath, Alinco , ADI, Icom with includes the 706 and the 756 and the IC-T7A without any problems so the problem in not operator error. I never had to send anything but the FT-100 back to be repaired. The FT-100 was DOA.

Having said all that I was fairly pleased with performance of the radio until a few days ago when I discovered that I am having intermittent problems with the Hi-SWR icon again. The problem seems to occur when the radio is operated with the Skywalker amp on 17,15,10 meters. No problems noted on 80,40,20 meters yet. I have not had time to check out what is causing the problem but I suspect it is a grounding problem or the power is feeding back into the 2 meter antenna. The antenna is a DK3 screwdriver mounted on a GMC small truck. The power out and swr seem good on the external meter with the amp on but the High SWR icon appears on the radio. When the amp is turned off the SWR icon goes away. It may be a problem with the amp not sure until I get time to check it out.
Has anyone had any problems when operating a amplifier?

John KA4U

5293. Re: [FT100] Lemons and other problems

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 02:28:59 UTC
From: Steven Palm
Topic: 5290 Message: 5293

To the list:

I apologize for starting the "lemon" thread.

I thought we were mostly adults here, so I asked a simply question as to why someone thought they were lemons. I thought I'd get a succinct answer, a list of defects, or some other useful information. Instead, every drags out their big sticks to beat each other to death or to continue to beat old dead horses that they've been carrying along.

As to the level of defects encountered on the "survey", I will say that a person is more likely to want to voice their opinion on something if it's giving them a problem. That's human nature. How often do you call customer service to tell them just how great their product/service is and how well it met your needs? You hardly ever do, but should you have a problem or question, you're right on the phone. I speculate that a lot of people who have purchased the rig probably are happy and feel no real need to deal with online surveys and the like.

On the other hand, you can't deny problems if they exist. The problems described are real problems encountered by real users of the radio. And it doesn't do any good to pretend they don't exist just because you don't happen to be affected by them.

It's a no-win situation, so please STOP the bickering about whether they are or are not lemons. That was not the point of my question, my question was an attempt to get a list of the known problems so I could determine if my particular rig may suffer from them.

As for the people who want to make fun of the Yaesu equipment, why are you even on this list to begin with? Trust me, everyone would be much better off if you went away. If you want the new Kenwood rig, or some other one, then please, go share your glee and excitement with those users. They'd love to have you, and we'd love to see you go. We just want to have an honest, but not demeaning or degrading, conversation about the radio we have all invested good money in. Extolling the virtues of other radios does NOTHING to accomplish this.

Please, let's get back to the mode of sharing good information with each other about our rigs, and leaving the snide negative rhetoric out of here. I'm sure we all have our own group of friends we can share those comments with and we don't have to pollute a email list like this with them.

Best Regards,

Steve

I have monitored the numerous postings concerning the swr icon on the HF bands. I use my FT-100 mostly on 2m ssb. I get the SWR icon and resulting foldback on 2m when I use my TE Systems 150 watt brick. I checked the input SWR and it is 1.0 to 1. I had no problems with my 706 with the same components.

Anyone else have problems in the VHF bands?

On the other hand, you can't deny problems if they exist. The problems described are real problems encountered by real users of the radio. And it doesn't do any good to pretend they don't exist just because you don't happen to be affected by them.

It's a no-win situation, so please STOP the bickering about whether they are or are not lemons. That was not the point of my question, my question was an attempt to get a list of the known problems so I could determine if my particular rig may suffer from them.

As for the people who want to make fun of the Yaesu equipment, why are you even on this list to begin with? Trust me, everyone would be much better off if you went away. If you want the new Kenwood rig, or some other one, then please, go share your glee and excitement

with those users. They'd love to have you, and we'd love to see you go. We just want to have an honest, but not demeaning or degrading, conversation about the radio we have all invested good money in. Extolling the virtues of other radios does NOTHING to accomplish this.

Please, let's get back to the mode of sharing good information with each other about our rigs, and leaving the snide negative rhetoric out of here. I'm sure we all have our own group of friends we can share those comments with and we don't have to pollute a email list like this with them.

Best Regards,

Steve

John:
Hmmm... You've been spending too much time listening to Al Gore.
To simply say that "out of the poll of 178 only 72 people never had problems..." is a misrepresentation, not only of the poll, but ignores what's not in the poll. You even included the 15 who don't even have FT-100's yet with those who "have had problems". You do the Democrats proud!
The way I read the poll results is that there's only 3 people who've decided to trade their FT-100 in on an Icom, the others are still using their radio. Also, only 17 had problems more than once or had their radio replaced, which leaves a total of about 20 who MAY be unhappy with their experience out of the 178 who responded. Also note that there's 766 members of this mail list, which leaves 588 who haven't even weighed in on the matter.
So I guess one could say that out of 766 people, only 3 decided they didn't like the radio. Ok, so that's a stretch, but it does make my point that it's unfair to call the FT-100 a lemon.

Three points:

1) This has nothing to do with the Democrats or the honorable Al Gore
2) Many people are on this list to figure out if they should spend their money (shall we say the surplus?) on the FT100 or wait for something better. Thus they don't all own FT100s.
3) If you got a bum FT100, Yaesu fixed or replaced it, and it later broke again, in my book that is two failures, not one.

Clearly the radio has problems. To say anything else is to be in denial.

Hi John ...

here have a similiar problem on a solid state 400Watts amp especially if I
am not using RF Vox and
keying it by the PTT . There seems to be some rf feedback into the FT100 . I
tried to block it by a
toroid(what you call "donut" type) but had no success so far.
On SSB the signal gets distorted and sometimes the HISWR Icon comes up.
Without the amp there are no problems on 10mtrs or any other band if I am
using it in the house.
With the mobile setup there seems to be some grounding problems but will
investigate that next spring.
(its getting colder here also ..hi).

73s
Walter
DK1BN

P.S I like the radio and but there seems to be no general fix for the rf
feedback problem.

5300. Remote kit modifications

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 11:02:31 UTC
From: The Simpsons
Topic: 5300 Message: 5300

I recently purchased the YSK100 remote kit but was disappointed to find the cable is permanently fixed to the main body of the radio using screws. I assumed there would be some sort of clip on bracket that mounted similar to the front panel.
My intention was to leave the remote kit in my vehicle and use the radio with the front panel attached in the house.
The other option is to cut the cable and use some type of small plug and socket arrangement so the radio and front panel can be removed easily for use elsewhere, being connected by the short pieces of cable attached to the radio and front panel. This way, extra extension cables could be made for use in other vehicles. It is not important that the front panel be attached to the front of the radio for inside use. I could always purchase more remote kits but not at the price they are (the budget has already been severely stretched!).
Does anyboy know if the cable is of some type of special construction (ie separately screened pairs or similar), or is it just a multiwire cable?

Thanks,
Grant, ZL2BK

5303. Your setup decides whether FT-100 is a lemon

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 12:48:59 UTC
From: Ignacy Misztal
Topic: 5303 Message: 5303

It seems that the HISWR icon occurs when the antenna has low impedances outside the operating frequency, or when that antenna is close to the radio. There is some feedback through the power cable and between VHF/UHF and HF circuitries. Also, teh microphone is susceptible to RF feedback, with that sensitivity changing from band to band.

It seems that if one operates a mobile antenna with a good ground, teh weaknesses of the radio do not show up. Same story with good outside antennas. For hams in such situations, everyone else gripes about FT-100 being a lemon. For those with less than perfect ground in mobile situations or short antennas close to teh shack or magnetic loop antennas, there is HI-SWR icon and perhaps poor audio through RF feedback through the microphone.

Been watching all the posts for some time and cannot believe how the same thing gets beat into the ground over and over. I remember back in the early 80's I along with many other amateurs purchased new Kenwood TS-830s and also remember the Mods that was done to them when they were first on the market and some people sent them back in disgust. I did the mods to mine and the Model has been a workhorse for many years. I own 2 FT-100(never been a Yeasu fan or owned there equipment) I have the D and the FT-100 and the 100 is used strictly in the mobile,it has been thru 4 VHF and above contests and several outings during tropo and E-Skip openings and has worked flawlessly. Did have he HiSWR icon problem a couple of times but found that moving the feedline and moving the 432 loops on the roof solved the problem. Have used both of them on hf with no problems and the 100 works everybit as well as the D for me. Guess I always use an external speaker so the speaker size makes no difference to me.

Seems the reflector is sometimes like the News cast on TV in that you mostly hear the bad news. Not saying there are not problems with the rig but I purchase them because of concerns 2 other hams had with its closest competitor and expected them to be just what they are,compact rig with some operating inconveniences but still full featured(otherwise would have purchased an 847 or such). I do like them and they do for me what I purchased them for.

I to enjoy the technical input on the reflector.

From: Brian Smithson
Topic: 5258 Message: 5305

Good morning!

I have built a portable station for travelling but it turns
out I don't really have time on my business trips to operate!
I put together a pretty complete station with components all
purchased within the last 3 months. Everything is mint and I
have all original boxes and manuals. I'd like to sell the
lot together but I'll entertain offers to 'break it up'.
Here's a list of what I have what I paid and when I bought it:

7/14/2000 Yaesu FT100D 1229.95
YSK-100 seperation kit 79.95
Technical suppliment 20.00 (?)
9/18/2000 CT-62 Data cable 29.95
XF-117A 6KHz filter (installed) 90.00
Heil AD-100 Mic adapter 24.95
Heil HDAT headphone attenuator 6.95
8/21/2000 LDG AT-11 auto-tuner 179.00
LDG 4.1 balun 30.00
7/29/2000 Astron SS-25 Power Supply 119.00
8/8/2000 Platt padded case with lock. The 199.50
FT100, LDG, and SS-25 fit nicely.
10/9/2000 B&W AP-10 Portable antenna 84.95
Total (less whatever shipping I paid) 2094.20

I am the original (non-smoking) owner of everything. The
FT100 and SS-25 were used about 4 hours max, the Heil
accessories and the CT-62 were never used and are still
in the plastic wrap. I assembled the AP-10 but never used
it.

I will ship the whole lot to the lower 48 for $1750.
Contact me directly please at bsmithson@....

Thanks and 73!

-Brian n8wrl

5306. FT100 NOT a LEMON HERE!

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 13:47:56 UTC
From: Booker, Andy
Topic: 5306 Message: 5306

2 years and counting! NO problems with the radio what so ever. Tunes on all bands and then some from 40 to 10 meters. I use separate antennas for HF and VHF/UHF.
The HF antenna is mounted on the rear spare Wheel holder on my 95 Pathfinder. Radio is under the front seat and the head (not mine) is stuck to the steering column. Radio is grounded to the seat / frame and the antenna has an extra ground strap to the truck body. Oh yea, I'm also using the ATAS 100 antenna. I'm also using a dual band VHF/UHF diamond antenna (short) and trunk lid mount.

I'll be happy to purchase all of your .. "LEMONS" .. at a used Lemon-discounted price if anyone wants to get rid of them. :-) I mean... these radios must be pretty awful for everyone to talk about them so. Lets say 10 cents on the US dollar?

Hamming in Georgia,
Andy

I wanted to apologize for sending out 2 empty responses to this thread. I'm still not sure how I did it, but my intention was not to participate in the thread at all. However, now that I have, I want to thank Steve Palm for drawing some very reasonable conclusions about the controversy in his follow-up posting below. At first, I thought Steve's original posting was a 'troll', i.e., a message calculated to send the group into a downward spiral of flames and bickering. I see now that Steve was just trying to get some well-reasoned responses to a question about the radio.

Regarding the much quoted poll (found in the 'polls' section of the FT100 group) I had thought about starting a new poll but decided it wouldn't be a good idea since, it too would be skewed and could be interpreted differently depending on the conclusions one was trying to draw. So the original poll with all its flaws will have to be good enough. If you look at the relative size of the bars ('never broke' 'works FB', and 'will never break'), they are clearly the majority of FT100 owners that responded (72% excluding the 15 users responders who don't have an FT100). My own radio is in the category of 'broke once and now works FB' and I'm happy with it. Adding those numbers together, 84% of the FT100 respondents have radios that are working fine. A few others have radios they exchanged or took more than one repair to get them working. I suppose that some of those people are satisfied and others are hopping mad. A few of the members are in the middle of having their radios repaired and don't know yet which category they will fall into, but I trust that they will let us know when the verdict is in.

Walter,

What is an "RF Vox"? That may be part of your problem...use the standard VOX. Also, you answer your own question here by saying the rig works perfectly in the house. Obviously, your mobile installation is the source of your problems, as are most of the complaints about the FT-100 on this board. Yaesu has no control of an individual's installation techniques. Mine works great AFTER I spent time getting it installed properly in my car, however, it took me a couple of weeks to learn what a proper installation really meant.

I didn't vote in the poll because I didn't see one, but put me down as an extremely happy FT-100 owner.

I have had my FT100 (9E Model) since July of 99, I have worked hundred if not thousands of contacts all over the world. All contacts were made from my car, You can boast about the 706 all you want but the RX cant even compare to the Ft100's.. Sure there are problems which Yaesu should address. Its my opinion that if Yaesu can build a radio from the ground up that they certainly could fix the problems too!! The lack of computer programmable memories adds to the fire. Even if they chrged for a firmeware upgrade, I would pay for it.
While the radio were in for such upgrades it could be fully serviced and repaired . I do say shame on Yaesu for not addressing such concerns, but fall short on calling the rig a lemon, in fact its Yaesu dropping the ball by not fixing the obvious problems here... I had the distorted audio problem which was fixed with a large toroid core on the coax. I am one of the lucky ones I guess. Its a shame to see such a good radio suffer from bad press only because the maker refuses to fix them right the first time.. Regards.. Richy

Yes that is what I found. I had a few problems I thought was the HI-swr problem. the radio with the FC-20 would not tune 17, 12 or 10 meters. Well I have the rig grounded and thought I will ground the FC-20. that made matters worse due to poor RF ground at the antenna. with the tuner off the radio would see the right SWR. After I took a large ground cable from the antenna mount to the frame most of it went away. One last problem was there is no rf chokes on the control cable between the rig and tuner. this creates a problem of rf getting into the radio. I put a snap on chock at the tuner on the control cable and all of my problems went away.

Just one note. I took my FT-757GX out to the car before I installed a better ground on the antenna, and it also had problems on 17, 12 and 10. So it is not just the 100 that does not like antennas with no ground. A friend of mine had a IC-706G, and when he used a mag mount antenna there were 3 freqs that would reset the radio when he would transmit. So the moral of the story is: ALWAYS make sure you have a good RF ground.

Subject: [FT100] Your setup decides whether FT-100 is a lemon

It seems that the HISWR icon occurs when the antenna has low impedances outside the operating frequency, or when that antenna is close to the radio. There is some feedback through the power cable and between VHF/UHF and HF circuitries. Also, teh microphone is susceptible to RF feedback, with that sensitivity changing from band to band.

It seems that if one operates a mobile antenna with a good ground, teh weaknesses of the radio do not show up. Same story with good outside antennas. For hams in such situations, everyone else gripes about FT-100 being a lemon. For those with less than perfect ground in mobile situations or short antennas close to teh shack or magnetic loop antennas, there is HI-SWR icon and perhaps poor audio through RF feedback through the microphone.

Hi Bob,

"RF Vox" (my translation from the german word -)) means TX/RX switching
of the amp activated by the RF input into the amplifier. I think the right
term in your language is "RF controlled TX/RX switching" ?
It is not a mobile installation and the FT100 is working great (no RF
feedback problems) without the amplifier.
I had some problems too with a mobile installation on 10mtrs. Here I solved
the problems with the ground straps on J5014 and J5015. But I did only
operate one sunday afternoon on 10mtrs after I made the modifications.

The output power of the FT100 into the linear amp is reduced to only about
15 watts if I am using the solid state
linear amp.
Maybe different grounding of the FT100 in this home installation will solve
the problem. I didn?t do any experiments yet because without the amp I have
no problems and I worked quite a lot of DX stations on CW and SSB without
it
using my 4el monobander on 10mtrs .
But from experience with the IC706 or even the old 735 I know that this
FT100 is certainly more sensitive to grounding problems etc. . I think NO9E
did describe the problems quite well in his posting.

Is there somebody out there using a linear amp with the FT100 ?

Anyway have fun with the little radio like I do.

73`s

Walter
DK1BN

By the way the FT100 works great on 9k6 Packet Radio and also on the other
digital modes like PACTOR,RTTY
and PSK31 on HF.

Ding ** Ding ** Ding!!!

We have a winner!

It is about time that someone came out and said what a lot of us here on the list have been feeling.

I think if we really want to go into a discussion to see if this rig is a lemon or not, we need to create an accurate poll.

Something like the following I think would shed a lot of light to where problems truly are.

(Again, this is for mobile FT100 users)

MOBILE FT100 USERS Survey

1. How do you supply power your FT100

a) Duh! From the cigarette lighter
b) From the fuse box
c) From a 12V 8 amp hr. gell cell battery in the backseat.
d) From the car battery with 16 gauge wire.
e) From the car battery with 8 gauge (or larger) wire.

2. How did you ground your radio?

a) I didn't.
b) What's a ground?
b) With some hook up wire to the closest nut I could see.
c) To some metal part on the vehicle.
d) With heavy braid (1/2" or larger) to the frame of the vehicle (removing paint if I had to from both the ATAS 100 mount as well as the frame) to ensure an electrical ground from the radio to the frame. Which I then measured with VOM.

3. Is your mount for the ATAS 100 (or other antenna) grounded?

a) No idea
b) Yeah, its bolted to some metal - shees!

c) Yeah, I checked it with a VOM, it is grounded to the vehicle.
d) Yeah, I checked it with a VOM, and it is grounded to the frame which reads the same on my VOM at different points on the vehicle.

4. If you have had High SWR issues you have done the following:

a) Nothing, and complained that this rig is a lemon. (Hell, the 2 meter antenna worked on that mount, why won't the ATAS-100!)
b) Returned it, as it needed to "get fixed".
b) Added a ground strap
c) Moved the installation of the antenna to a different point on the vehicle (with proper grounding techniques) and tried it there.
d) Moved the radio to a different location and tried everything all over again.

Someone PLEASE Post that on a web site, and lets see the truth be revealed to some of these installations.

Sure, There have been some folks here who have claimed that they have gotten DOA radios. That is either one of three things:
a) Poor quality testing practice NOT GOOD!
b) Poor shipping NOT GOOD!
c) Untruthful individuals (either the one selling it, or the one buying it)

Either way, receiving a DOA radio to be blunt, sucks. I sympathize with those who have gotten a bum deal, however, I am sure that YAESU made an attempt to rectify the situation. If they didn't, well that is a customer service issue, and nothing to do with the FT100.

However, as it has been said before, most of the postings here to the list are from folks who have had problems installing their radio into cars / vans and trucks. Heck, we SHOULD all run into problems with all of the plastic that are in modern day vehicles! (For you who have not tried to install your FT100 in your car, and are still reading this, consider yourself lucky.) It is a lot of work, and I emphasize with those who have tried and failed. It has taken me close to three weeks to get everything working the way I wanted.

As I can attest, without proper grounding, power, and antenna / radio placement, things are NOT going to work as they should. I thought I had a great system and then I started seeing SWR issues. Low and behold, my grounding was terrible, I was feeding power with LONG runs of 12 gauge power feeds, my extra cable length from my remote mounting kit was unorganized and causing interference issues, and I had a host of other "short cuts" which seemed to be "good enough" at the time that I rushed to install everything.

You all know that I am speaking the truth here.

Like AA, Admitting that you have a problem is the first step.

So now what?

There are several good sites on the web that if one takes the time to read can learn a GREAT DEAL about HF and VHF mobile installations. It is all about taking the time to learn about what you are doing, and then doing it R I G H T. Then I think you will see that a lot of these "problems" will disappear.

Some reading material:
http://www.k2bj.com/ (A great site, wonderful FLOWCHARTS!)
http://www.qsl.net/ka6wke/ (Another great one!)

http://home.pacbell.net/lcobb/hfmobile.htm
(good links)
http://www.arrl.org/tis/info/Mobile-H.html
http://wb4huc.home.texas.net/mobilehf.htm

My personal favorite:
http://www.primenet.com/~nx7u/mobile/home_mobile.html
(Just what I was looking for!)

If you want to sell your rig by all means, do it and move on. Lets not complain here to everyone that the FT100 is "junk" that you are going to sell it. Sell it and go away.

There are a lot of folks here on this list that provide a lot of information and can really help with your situation. However finding the quality information is becoming harder and harder to find through the "noise".

In closing, if you do sell your "junk", don't get frustrated when you pull up next to me at a stop light and can't even hear the fellow I am working as you fiddle with your I .. Ic.. Ico.. "other" radio.

Jay and the group
These are some good comments.
another thought and one that I considered before buying my first
FT-100. Most of the problems seem to be ATAS100 related. I have
seen some that are not but those are in the minority.
In My Opinion (take that and $.50 to buy a cup of coffee)
most of the problems are antenna related. The first defect with
the ATAS 100 is the performance on 75 meters. I can not complain
about this one because it was not designed to work there.
Even though it is not designed to work on this band this
defect makes the antenna absolutely worthless and therefore
I have not tried it or had any problems related to it.
My home made DK3 exhibited a few of the high SWR problems
(it is mounted directly to the frame with VERY solid steel
monuting system) but they were easily solved with smap on
ferite beads. I had a problem with the tx ctcss tone on
440 FM but Yaesu fixed this and did allignment and updates
in less than 2 weeks. No further problems on the first one
and the 2nd radio has been and is flawless.
There have been some problems with the radio BUT
I have compared it to the Icom and the Kenwood comparable
radios and the recieve is the hands down winner.
With Icom's tech support (or lack there of) problems
and Kenwood's reputation with the 440 radios(the worst hf radio ever
built)
the FT100 is great.

Just my 2 cents worth.

5316. lemons vs FT 100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-10-31 21:49:15 UTC
From: remted@usa.net
Topic: 5316 Message: 5316

Seems to be way too much time spent reading and writing about such trivial matters as lemons. MY experience with MY FT100 was bad at first until Tech support fixed it. So it took twice to get the job done, so it took days at a time without my mobile rig. So it was not fun. The good news is that now it works fine. The good news is that now it gets great signal/audio reports. Now the good news is that it's NOT A LEMON ANYMORE!!! IT IS A PEACH!!! A most enjoyable piece of equipment to work with. Stop the bitchin!?!?!?! If you don't like your lemon get off it and get something else and get outa here!~ Go do something you like (like talk on other radios).

Whatever happened to helpful EGROUPS? Where folks ragchewed about how best to use something.

That's my two "scents" worth on lemons.

5317. The truth is out! - at the lemonade stand

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-01 02:56:17 UTC
From: Glenn Cummings
Topic: 5317 Message: 5317

Welcome to another FT-100 lemonade stand. No lemons here, just great lemonade
The survey answers are followed by my experiences. I hope those that are still holding lemons read my lemonade recipe below

MOBILE FT100 USERS Survey

1. How do you supply power your FT100
f) none of the above
From the car battery, with the stock 12 gauge harness that came with the radio

2. How did you ground your radio?
c) To some metal part on the vehicle. (the cab floor)

3. Is your mount for the ATAS 100 (or other antenna) grounded?
d) Yeah, I checked it with a VOM, and it is grounded to the frame which
reads the same on my VOM at different points on the vehicle.

4. If you have had High SWR issues you have done the following:
c) Moved the installation of the antenna to a different point on the vehicle
(with proper grounding techniques) and tried it there.

A new question:
My car has as much metal as a
a) plastic shopping bag
b) Campbell soup can
c) yugo or metro
d) a real car or truck

A recipe for lemonade:
I did a fair amount of reading about mobile installations before I started drilling holes. I quickly learned that a HF mobile installation could present some problems not encountered by those who have done installations for VHF/UHF (and CeeBee yabetcha there goodbuddy). By following the information that was available, I have ended up with an installation that hasn't allowed me to duplicate any of the problems spouted around this newsgroup*. The vehicle is a nice big 97 Dodge Ram 2500 QuadCab Long Bed 4wd (nice chuck of metal, huh)

First, I found the right location for easy access and
control of the radio.
- firmly mounted the pana-vise on the transmission hump with
drilled through holes and stainless hardware
- assured a good ground at the radio
- routed the power harness from the battery to the radio,
avoiding as many electrical components and wiring as
possible
- added several clamp-on common mode chokes on the power
pigtail on the radio
- added a couple clamp-on common mode chokes at the VHF/UHF
pigtail
- added ground straps from cab and bed to frame, added
ground strap from hood to cab
- used a MFJ-triple mag mount for the ATAS-100.
- added a antenna ground (zip cord, can you believe it)
after I experienced intermittent tuning/high SWR problems on
40m and 10m (hadn't tried 6m at that time)
- added a 30 foot coil of RG-58M under the console (to
change the feed line length)**
- improved the antenna ground with copper plumbers tape from
bolt on mag mount to 1/4 inch ground stud added to roof***
(threw zip cord in bed of pickup next to Sharp's cans)
- cleaned up the wiring around the back of the rig once
everything was working great

The rig tunes quickly on all bands HF/6m. I use a Larsen
NMO 2/70 for the VHF/UHF side
I think that those that report problems ought to thoroughly
go through their installations and check things out. It's
probably cheaper and faster than sending the rig into Yaesu,
just to experience the same problem again upon
re-misinstallation.. Can't say there isn't any lemons, but
since I grounded things, I haven't had the problems.

However, I am one who wants to see memory storage supported
via CAT/clone, I really though it would do it when I bought
the rig). I have the FT-90R / VX-1R / TH-D7A and a
FT-757GXII that seem to do this just fine thank you. Why
this $1200 radio can't manage the 300 memories is beyond
me. We aren't talking break-through technology.

Notes follow:

* My first installation was a rush home and try-it, you
know, sitting on the seat with wires dangling. I really
didn't expect it to perform properly, but couldn't wait to
see it light up and make some noise. During my true
installation process, I experienced the no-tune/high-swr
problem on 40m and 10m. I didn't blame the rig, I just new
that I couldn't rely on the mag mount (the big MFJ-triple
mag mount) to couple a RF-ground. Trying to do the best I

could quickly, I grabbed some old zip cord and fastened it between the ground screw on the magmount and a screw on the bed-rail. Shoot... it worked great for the two weeks that I ran it that way. Finally put in something respectable: the copper ground strap. Looked so nice, I even emptied out all the O'douls and Sharps cans from the back. and shined up my NRA sticker.

**Both the feed line length and ground strap improved the efficiency and speed of the ATAS-100. It doesn't seem to hunt as much. It's really quite impressive now.

*** I removed the high break light above the rear window of the PickUp and drilled a 1/4 inch hole through the roof so I could gain access in the brake light compartment. I scraped the paint on the underside (in the compartment), used stainless steel hardware with a star lock washer up through the bottom, added a thin rubber washer and stainless washer and nut at the top. I secure the copper plumbers tape with wing-nut. This installation method was selected so I could 'lay-down' the antenna if I need to for low-clearance areas. I just spin off the wingnut, and pop the magmount loose and lay it in the bed. Since my coax is still routed through the trucks back window, it has enough slack.

I have purchased a though roof PL-259 mount and will be adapting the mag-mount with a shorter coax-PL-259 pigtail that I will screw down to the roof mount PL-259. This will make it easy to remove the whole unit if necessary. If I sell the truck, I will remove the ground stud and push in a plastic domed plug.

i've only had my FT100 for a couple of weeks and it isn't used mobile, yet... i do intend it for the camper next summer where i will be using monoband hamsticks... however, in the shack, it has performed as it is expected to thus far...

i use a B&K folded dipole up about 40 feet... no problems with it either... 2 to 1 swr or less on all but 1.8... would be there too if it were up in the air higher...

i can even work 6 meters with it, which is a perk because they don't say it can...

its performing as well as any i've had, but then, in the 11 years i have had my ticket, i've only owned 6 radios... i can't afford to swap around each time a new one comes out...

so my databank is not as deep as some...

seeya!

5320. RF back into the radio

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-01 18:11:13 UTC
From: Steven Palm
Topic: 5318 Message: 5320

Okay, this is probably not even an FT-100 specific issue, but I'm hoping some of you with FT-100 rigs will have encountered this in your current or previous installations and can provide some advice.

I am using the FT-100 with the ATAS-100 in my 94 Honda Civic. I have the ATAS mounted with a trunk mount on the hood, and it is grounded. I have no problems with tuning up on any band, and it does so on the first pass, I don't have to have it re-seek to find it's spot.

However, one of the first contacts I have made with the rig yielded a report that I had distortion on my signal, likely an RF source getting back into the rig.

I have the head remoted, and it has the supplied ferrite collar on it by the radio. I did, though, use the mike extension which does not have a collar, and have an external speaker plugged in which also does not have a collar.

Any suggestions on where specifically to look or how to help test for this RF problem? I know this is pretty generic, but I'm hoping somone can offer some wisdom.

Since this isn't purlely FT-100 related, you may choose to use e-mail direct to me, and I would happily summamrize to the list or to anyone who asks me for the information I get.

Thanks!

Steven

5321. A different FT100 Problem

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-01 19:36:17 UTC
From: prforbes@tbsa.com.au
Topic: 5321 Message: 5321

I have an FT100 set up in my Jeep, with the remote head mounted near the gear stick and the main unit mounted in the rear wheel well, together with a 90 AmpHour deep cycle battery. (The rear wheel has been removed to a carrier on the back bumper).

Everything works fine (no RF problems) but I have found that the CW key line socket on the FT100 rear will constantly disengage with vibration.

It seems that the 3.5 mm stereo socket has a plastic mounting to the case of the rig, instead of a metal one, so the only earth connection is through the spring connection to the plug, similar to the tip and ring connections. This means that there is a very weak connection to the plug which constantly works itself out from the socket. I have tried cable tying it back to the FT100, maintaining inwards pressure and have considered using some silastic to form a holding seal.

HAS ANYONE ELSE EXPERIENCED THIS EFFECT OR IS IT A PROBLEM SOCKET IN MY RIG ONLY?

(1) I have tried different manufacture plugs in case there is a tolerance issue

(2) All other sockets such as mike, speaker etc. work fine.

Cheers

Peter Forbes VK3QI

5322. 2nd poll response

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-01 20:22:38 UTC
From: hugh martin
Topic: 5322 Message: 5322

(1) I supplied power to the ft-100 using 12 guage wire directly to the battery.
(2) I did not ground the radio (it is hanging in a mest net attached to the plastic interior storage area)
(3) Atas100 is grounded to the fender via the mounting bracket with simple metal screws
(4) had Hi SWR indication on 6m installed a 3 foot jumper in coax to lengthen it.
No problems at all.. radio and antenna work great...I am using a diamond 2m/440 as it was installed on the vehicle prior to the radio purchase. I am also using a 12v dow key to electronically swith from the atas100 to a 75m ham stick mounted on the other rear fender of my explorer. As for the heated discussions, its a free country...complain all you wish, however, as I recently discovered on a different ft100 page several of the complainers did not have amateur radio license according to the fcc database. Check what you read, in my opinion anyone who uses a false call sign to post a message has no credibility with a post. thats my 2 cents worth...hugh kd4bcf

Dosent anybody have anything nice to say about the FT 100 ????
All everybody does is moan (well 99 percent of you) your worse than a group
of old women
so here I am moaning about you lot moaning.
Hope someone agrees with me

Dear All,

As a democrat and a liberal, I find it highly offensive to read insults on this newsgroup. If you are Republican and Conservative, that's your perogative and I respect your right to feel that way politically without hurling insults at you or your political candidate. Please show me the same courtesy. In addition, such commentary is way off topic and more appropriate for other newsgroups.

Subject: Your setup decides whether FT-100 is a lemon

It seems that the HISWR icon occurs when the antenna has low impedances outside the operating frequency, or when that antenna is close to the radio. There is some feedback through the power cable and between VHF/UHF and HF circuitries. Also, teh microphone is susceptible to RF feedback, with that sensitivity changing from band to band.

It seems that if one operates a mobile antenna with a good ground, teh weaknesses of the radio do not show up. Same story with good outside antennas. For hams in such situations, everyone else gripes about FT-100 being a lemon. For those with less than perfect ground in mobile situations or short antennas close to teh shack or magnetic loop antennas, there is HI-SWR icon and perhaps poor audio through RF feedback through the microphone.

Subject: Re: Why a Lemon?

Been watching all the posts for some time and cannot believe how the same thing gets beat into the ground over and over. I remember back in the early 80's I along with many other amateurs purchased new Kenwood TS-830s and also remember the Mods that was done to them when they were first on the market and some people sent them back in disgust. I did the mods to mine and the Model has been a workhorse for many years. I own 2 FT-100(never been a Yeasu fan or owned there equipment) I have the D and the FT-100 and the 100 is used strictly in the mobile,it has been thru 4 VHF and above contests and several outings during tropo and E-Skip openings and has worked flawlessly. Did have he HiSWR icon problem a couple of times but found that moving the feedline and moving the 432 loops on the roof solved the problem. Have used both of them on hf with no problems and the 100 works everybit as well as the D for me. Guess I always use an external speaker so the speaker size makes no difference to me.

Seems the reflector is sometimes like the News cast on TV in that you mostly hear the bad news. Not saying there are not problems with the rig but I purchase them because of concerns 2 other hams had with its closest competitor and expected them to be just what they are,compact rig with some operating inconveniences but still full featured(otherwise would have purchased an 847 or such). I do like them and they do for me what I purchased them for.

I to enjoy the technical input on the reflector.

Subject: Portable station for sale

Good morning!

I have built a portable station for travelling but it turns
out I don't really have time on my business trips to operate!
I put together a pretty complete station with components all
purchased within the last 3 months. Everything is mint and I
have all original boxes and manuals. I'd like to sell the
lot together but I'll entertain offers to 'break it up'.
Here's a list of what I have what I paid and when I bought it:

7/14/2000 Yaesu FT100D 1229.95
YSK-100 seperation kit 79.95
Technical suppliment 20.00 (?)
9/18/2000 CT-62 Data cable 29.95

XF-117A 6KHz filter (installed) 90.00
Heil AD-100 Mic adapter 24.95
Heil HDAT headphone attenuator 6.95
8/21/2000 LDG AT-11 auto-tuner 179.00
LDG 4.1 balun 30.00
7/29/2000 Astron SS-25 Power Supply 119.00
8/8/2000 Platt padded case with lock. The 199.50
FT100, LDG, and SS-25 fit nicely.
10/9/2000 B&W AP-10 Portable antenna 84.95
Total (less whatever shipping I paid) 2094.20

I am the original (non-smoking) owner of everything. The
FT100 and SS-25 were used about 4 hours max, the Heil
accessories and the CT-62 were never used and are still
in the plastic wrap. I assembled the AP-10 but never used
it.

I will ship the whole lot to the lower 48 for $1750.
Contact me directly please at bsmithson@....

Thanks and 73!

Subject: FT100 NOT a LEMON HERE!

2 years and counting! NO problems with the radio what so ever. Tunes on
all bands and then some from 40 to 10 meters. I use separate antennas for
HF and VHF/UHF.
The HF antenna is mounted on the rear spare Wheel holder on my 95
Pathfinder. Radio is under the front seat and the head (not mine) is stuck
to the steering column. Radio is grounded to the seat / frame and the
antenna has an extra ground strap to the truck body. Oh yea, I'm also using
the ATAS 100 antenna. I'm also using a dual band VHF/UHF diamond antenna
(short) and trunk lid mount.

I'll be happy to purchase all of your .. "LEMONS" .. at a used
Lemon-discounted price if anyone wants to get rid of them. :-) I mean...
these radios must be pretty awful for everyone to talk about them so. Lets
say 10 cents on the US dollar?

Hamming in Georgia,
Andy

Subject: Re: Lemons and other problems

I wanted to apologize for sending out 2 empty responses to this thread. I'm still not sure how I did it, but my intention was not to participate in the thread at all. However, now that I have, I want to thank Steve Palm for drawing some very reasonable conclusions about the controversy in his follow-up posting below. At first, I thought Steve's original posting was a 'troll', i.e., a message calculated to send the group into a downward spiral of flames and bickering. I see now that Steve was just trying to get some well-reasoned responses to a question about the radio.

Regarding the much quoted poll (found in the 'polls' section of the FT100 group) I had thought about starting a new poll but decided it wouldn't be a good idea since, it too would be skewed and could be interpreted differently depending on the conclusions one was trying to draw. So the original poll with all its flaws will have to be good enough. If you look at the relative size of the bars ('never broke' 'works FB', and 'will never break'), they are clearly the majority of FT100 owners that responded (72% excluding the 15 users responders who don't have an FT100). My own radio is in the category of 'broke once and now works FB' and I'm happy with it. Adding those numbers together, 84% of the FT100 respondents have radios that are working fine. A few others have radios they exchanged or took more than one repair to get them working. I suppose that some of those people are satisfied and others are hopping mad. A few of the members are in the middle of having their radios repaired and don't know yet which category they will fall into, but I trust that they will let us know when the verdict is in.

Subject: Re: Lemons and other problems

Walter,

What is an "RF Vox"? That may be part of your problem...use the
standard VOX. Also, you answer your own question here by saying the
rig works perfectly in the house. Obviously, your mobile
installation is the source of your problems, as are most of the
complaints about the FT-100 on this board. Yaesu has no control of
an individual's installation techniques. Mine works great AFTER I
spent time getting it installed properly in my car, however, it took
me a couple of weeks to learn what a proper installation really meant.

I didn't vote in the poll because I didn't see one, but put me down
as an extremely happy FT-100 owner.

Subject: Calm Down

I have had my FT100 (9E Model) since July of 99, I have worked hundred if
not thousands of contacts all over the world. All contacts were made from my
car, You can boast about the 706 all you want but the RX cant even compare
to
the Ft100's.. Sure there are problems which Yaesu should address. Its my
opinion that if Yaesu can build a radio from the ground up that they
certainly could fix the problems too!! The lack of computer programmable
memories adds to the fire. Even if they chrged for a firmeware upgrade, I
would pay for it.
While the radio were in for such upgrades it could be fully serviced and
repaired . I do say shame on Yaesu for not addressing such concerns, but
fall
short on calling the rig a lemon, in fact its Yaesu dropping the ball by not
fixing the obvious problems here... I had the distorted audio problem which
was fixed with a large toroid core on the coax. I am one of the lucky ones I
guess. Its a shame to see such a good radio suffer from bad press only
because the maker refuses to fix them right the first time.. Regards..
Richy

Subject: RE: Your setup decides whether FT-100 is a lemon

Yes that is what I found. I had a few problems I thought was the HI-swr
problem. the radio with the FC-20 would not tune 17, 12 or 10 meters. Well I
have the rig grounded and thought I will ground the FC-20. that made matters
worse due to poor RF ground at the antenna. with the tuner off the radio
would see the right SWR. After I took a large ground cable from the antenna
mount to the frame most of it went away. One last problem was there is no rf
chokes on the control cable between the rig and tuner. this creates a
problem of rf getting into the radio. I put a snap on chock at the tuner on
the control cable and all of my problems went away.

Just one note. I took my FT-757GX out to the car before I installed a better ground on the antenna, and it also had problems on 17, 12 and 10. So it is not just the 100 that does not like antennas with no ground. A friend of mine had a IC-706G, and when he used a mag mount antenna there were 3 freqs that would reset the radio when he would transmit. So the moral of the story is: ALWAYS make sure you have a good RF ground.

Subject: Re: Re:RF feedback problems with FT100(was Lemons and other problems)

Hi Bob,

"RF Vox" (my translation from the german word -)) means TX/RX switching of the amp activated by the RF input into the amplifier. I think the right term in your language is "RF controlled TX/RX switching" ?
It is not a mobile installation and the FT100 is working great (no RF feedback problems) without the amplifier.
I had some problems too with a mobile installation on 10mtrs. Here I solved the problems with the ground straps on J5014 and J5015. But I did only operate one sunday afternoon on 10mtrs after I made the modifications.

The output power of the FT100 into the linear amp is reduced to only about 15 watts if I am using the solid state
linear amp.
Maybe different grounding of the FT100 in this home installation will solve the problem. I didn?t do any experiments yet because without the amp I have no problems and I worked quite a lot of DX stations on CW and SSB without it
using my 4el monobander on 10mtrs .
But from experience with the IC706 or even the old 735 I know that this FT100 is certainly more sensitive to grounding problems etc. . I think NO9E did describe the problems quite well in his posting.

Is there somebody out there using a linear amp with the FT100 ?

Anyway have fun with the little radio like I do.

73`s

Walter
DK1BN

By the way the FT100 works great on 9k6 Packet Radio and also on the other digital modes like PACTOR,RTTY
and PSK31 on HF.

Ding ** Ding ** Ding!!!

We have a winner!

It is about time that someone came out and said what a lot of us here on the list have been feeling.

I think if we really want to go into a discussion to see if this rig is a lemon or not, we need to create an accurate poll.

Something like the following I think would shed a lot of light to where problems truly are.

(Again, this is for mobile FT100 users)

MOBILE FT100 USERS Survey

1. How do you supply power your FT100

a) Duh! From the cigarette lighter
b) From the fuse box
c) From a 12V 8 amp hr. gell cell battery in the backseat.
d) From the car battery with 16 gauge wire.
e) From the car battery with 8 gauge (or larger) wire.

2. How did you ground your radio?

a) I didn't.
b) What's a ground?
b) With some hook up wire to the closest nut I could see.
c) To some metal part on the vehicle.
d) With heavy braid (1/2" or larger) to the frame of the vehicle (removing paint if I had to from both the ATAS 100 mount as well as the frame) to ensure an electrical ground from the radio to the frame. Which I then measured with VOM.

3. Is your mount for the ATAS 100 (or other antenna) grounded?

a) No idea
b) Yeah, its bolted to some metal - shees!
c) Yeah, I checked it with a VOM, it is grounded to the vehicle.
d) Yeah, I checked it with a VOM, and it is grounded to the frame which reads the same on my VOM at different points on the vehicle.

4. If you have had High SWR issues you have done the following:

a) Nothing, and complained that this rig is a lemon. (Hell, the 2 meter antenna worked on that mount, why won't the ATAS-100!)
b) Returned it, as it needed to "get fixed".
b) Added a ground strap
c) Moved the installation of the antenna to a different point on the vehicle (with proper grounding techniques) and tried it there.
d) Moved the radio to a different location and tried everything all over again.

Someone PLEASE Post that on a web site, and lets see the truth be revealed to some of these installations.

Sure, There have been some folks here who have claimed that they have gotten DOA radios. That is either one of three things:
a) Poor quality testing practice NOT GOOD!
b) Poor shipping NOT GOOD!
c) Untruthful individuals (either the one selling it, or the one buying it)

Either way, receiving a DOA radio to be blunt, sucks. I sympathize with those who have gotten a bum deal, however, I am sure that YAESU made an attempt to rectify the situation. If they didn't, well that is a customer service issue, and nothing to do with the FT100.

However, as it has been said before, most of the postings here to the list are from folks who have had problems installing their radio into cars / vans and trucks. Heck, we SHOULD all run into problems with all of the plastic that are in modern day vehicles! (For you who have not tried to install your FT100 in your car, and are still reading this, consider yourself lucky.) It is a lot of work, and I emphasize with those who have tried and failed. It has taken me close to three weeks to get everything working the way I wanted.

As I can attest, without proper grounding, power, and antenna / radio placement, things are NOT going to work as they should. I thought I had a great system and then I started seeing SWR issues. Low and behold, my grounding was terrible, I was feeding power with LONG runs of 12 gauge power feeds, my extra cable length from my remote mounting kit was unorganized and causing interference issues, and I had a host of other "short cuts" which seemed to be "good enough" at the time that I rushed to install everything.

You all know that I am speaking the truth here.

Like AA, Admitting that you have a problem is the first step.

So now what?

There are several good sites on the web that if one takes the time to read can learn a GREAT DEAL about HF and VHF mobile installations. It is all about taking the time to learn about what you are doing, and then doing it R I G H T. Then I think you will see that a lot of these "problems" will disappear.

Some reading material:
http://www.k2bj.com/ (A great site, wonderful FLOWCHARTS!)
http://www.qsl.net/ka6wke/ (Another great one!)

http://home.pacbell.net/lcobb/hfmobile.htm
(good links)
http://www.arrl.org/tis/info/Mobile-H.html
http://wb4huc.home.texas.net/mobilehf.htm

My personal favorite:
http://www.primenet.com/~nx7u/mobile/home_mobile.html
(Just what I was looking for!)

If you want to sell your rig by all means, do it and move on. Lets not complain here to everyone that the FT100 is "junk" that you are going to sell it. Sell it and go away.

There are a lot of folks here on this list that provide a lot of information and can really help with your situation. However finding the quality information is becoming harder and harder to find through the "noise".

In closing, if you do sell your "junk", don't get frustrated when you pull up next to me at a stop light and can't even hear the fellow I am working as you fiddle with your I .. Ic.. Ico.. "other" radio.

Subject: Re: The truth is out! - long

Jay and the group
These are some good comments.
another thought and one that I considered before buying my first FT-100. Most of the problems seem to be ATAS100 related. I have seen some that are not but those are in the minority.
In My Opinion (take that and $.50 to buy a cup of coffee) most of the problems are antenna related. The first defect with the ATAS 100 is the performance on 75 meters. I can not complain about this one because it was not designed to work there. Even though it is not designed to work on this band this defect makes the antenna absolutely worthless and therefore I have not tried it or had any problems related to it.
My home made DK3 exhibited a few of the high SWR problems (it is mounted directly to the frame with VERY solid steel monuting system) but they were easily solved with smap on

ferite beads. I had a problem with the tx ctcss tone on
440 FM but Yaesu fixed this and did allignment and updates
in less than 2 weeks. No further problems on the first one
and the 2nd radio has been and is flawless.
There have been some problems with the radio BUT
I have compared it to the Icom and the Kenwood comparable
radios and the recieve is the hands down winner.
With Icom's tech support (or lack there of) problems
and Kenwood's reputation with the 440 radios(the worst hf radio ever
built)
the FT100 is great.

Just my 2 cents worth.

Subject: lemons vs FT 100

Seems to be way too much time spent reading and writing about such trivial matters as lemons. MY experience with MY FT100 was bad at first until Tech support fixed it. So it took twice to get the job done, so it took days at a time without my mobile rig. So it was not fun. The good news is that now it works fine. The good news is that now it gets great signal/audio reports. Now the good news is that it's NOT A LEMON ANYMORE!!! IT IS A PEACH!!! A most enjoyable piece of equipment to work with. Stop the bitchin!?!?!?! If you don't like your lemon get off it and get something else and get outa here!~ Go do something you like (like talk on other radios).

Whatever happened to helpful EGROUPS? Where folks ragchewed about how best to use something.

That's my two "scents" worth on lemons.

From: Glenn Cummings <kg7il@...>
Subject: The truth is out! - at the lemonade stand

Welcome to another FT-100 lemonade stand. No lemons here, just great lemonade
The survey answers are followed by my experiences. I hope those that are still holding lemons read my lemonade recipe below

MOBILE FT100 USERS Survey

1. How do you supply power your FT100
f) none of the above
From the car battery, with the stock 12 gauge harness that came with the radio

2. How did you ground your radio?
c) To some metal part on the vehicle. (the cab floor)

3. Is your mount for the ATAS 100 (or other antenna) grounded?
d) Yeah, I checked it with a VOM, and it is grounded to the frame which
reads the same on my VOM at different points on the vehicle.

4. If you have had High SWR issues you have done the following:
c) Moved the installation of the antenna to a different

point on the vehicle
(with proper grounding techniques) and tried it there.

A new question:
My car has as much metal as a
a) plastic shopping bag
b) Campbell soup can
c) yugo or metro
d) a real car or truck

A recipe for lemonade:
I did a fair amount of reading about mobile installations before I started drilling holes. I quickly learned that a HF mobile installation could present some problems not encountered by those who have done installations for VHF/UHF (and CeeBee yabetcha there goodbuddy). By following the information that was available, I have ended up with an installation that hasn't allowed me to duplicate any of the problems spouted around this newsgroup*. The vehicle is a nice big 97 Dodge Ram 2500 QuadCab Long Bed 4wd (nice chuck of metal, huh)

First, I found the right location for easy access and control of the radio.
- firmly mounted the pana-vise on the transmission hump with drilled through holes and stainless hardware
- assured a good ground at the radio
- routed the power harness from the battery to the radio, avoiding as many electrical components and wiring as possible
- added several clamp-on common mode chokes on the power pigtail on the radio
- added a couple clamp-on common mode chokes at the VHF/UHF pigtail
- added ground straps from cab and bed to frame, added ground strap from hood to cab
- used a MFJ-triple mag mount for the ATAS-100.
- added a antenna ground (zip cord, can you believe it) after I experienced intermittent tuning/high SWR problems on 40m and 10m (hadn't tried 6m at that time)
- added a 30 foot coil of RG-58M under the console (to change the feed line length)**
- improved the antenna ground with copper plumbers tape from bolt on mag mount to 1/4 inch ground stud added to roof*** (threw zip cord in bed of pickup next to Sharp's cans)
- cleaned up the wiring around the back of the rig once everything was working great

The rig tunes quickly on all bands HF/6m. I use a Larsen NMO 2/70 for the VHF/UHF side
I think that those that report problems ought to thoroughly

go through their installations and check things out. It's probably cheaper and faster than sending the rig into Yaesu, just to experience the same problem again upon re-misinstallation.. Can't say there isn't any lemons, but since I grounded things, I haven't had the problems.

However, I am one who wants to see memory storage supported via CAT/clone, I really though it would do it when I bought the rig). I have the FT-90R / VX-1R / TH-D7A and a FT-757GXII that seem to do this just fine thank you. Why this $1200 radio can't manage the 300 memories is beyond me. We aren't talking break-through technology.

Notes follow:

* My first installation was a rush home and try-it, you know, sitting on the seat with wires dangling. I really didn't expect it to perform properly, but couldn't wait to see it light up and make some noise. During my true installation process, I experienced the no-tune/high-swr problem on 40m and 10m. I didn't blame the rig, I just new that I couldn't rely on the mag mount (the big MFJ-triple mag mount) to couple a RF-ground. Trying to do the best I could quickly, I grabbed some old zip cord and fastened it between the ground screw on the magmount and a screw on the bed-rail. Shoot... it worked great for the two weeks that I ran it that way. Finally put in something respectable: the copper ground strap. Looked so nice, I even emptied out all the O'douls and Sharps cans from the back. and shined up my NRA sticker.

**Both the feed line length and ground strap improved the efficiency and speed of the ATAS-100. It doesn't seem to hunt as much. It's really quite impressive now.

*** I removed the high break light above the rear window of the PickUp and drilled a 1/4 inch hole through the roof so I could gain access in the brake light compartment. I scraped the paint on the underside (in the compartment), used stainless steel hardware with a star lock washer up through the bottom, added a thin rubber washer and stainless washer and nut at the top. I secure the copper plumbers tape with wing-nut. This installation method was selected so I could 'lay-down' the antenna if I need to for low-clearance areas. I just spin off the wingnut, and pop the magmount loose and lay it in the bed. Since my coax is still routed through the trucks back window, it has enough slack.

I have purchased a though roof PL-259 mount and will be adapting the mag-mount with a shorter coax-PL-259 pigtail that I will screw down to the roof mount PL-259. This will make it easy to remove the whole unit if necessary. If I

sell the truck, I will remove the ground stud and push in a
plastic domed plug.

Hello
I presently own a 6 yr. old FT1000MP no problems (none), a FT1000MP mark V, six months old no problems , I own an early model FT100 which was returned for service twice all because of my experiments with remote antenna control. Yaesu repaired the radio both times under warranty, even though I was prepared to pay for my blunders. I have a FT100d and ATAS 100 antenna combination in my truck, what a great little mobile setup. I had to improve my antenna grounding one time. There is no need for more coax than needed to reach the antenna, let no one tell you otherwise. The FT100D has been bullet proof, bouncing around with me in my truck and performing flawlessly
Just my 2 cents worth. Thanks Ralph k5mog

Peter:
Try a little silicone seal. Plug the connector in then put a small dab where the connector enters the jack, just on the surface. It should clean up just fine and will hold the connector with no problem.

Gary:
I'm not sure how the other person has theirs setup, but I also have a separate battery in my truck for running the radios. My radios are mounted inside on a flat area over the driver's side rear tire. I mounted a glass mat sealed deep cycle battery close to the radios. That battery is tied to a charge controller (a switched type that I got at West Marine) that's located at the engine starting batteries up front (2 starting batteries since it's a diesel). The cable between the charge controller and the radio battery is a No 8 welding cable with 150 amp fuses on both ends. I then have a 50 amp circuit breaker feeding the radio equipment off of the battery. The DC ground for the battery and radio equipment is tied to the truck body right at the radios. Since the body is only providing the DC return path for charging the battery and not for running the radios, there's no ill effect in doing so. The charge controller presents a minimun voltage drop when charging the battery (not sure what it's using for switching).

Gary,

There is the hard (expensive)way and the easy (cheap)way to do it.

(Hard way) Buy an electronic switching unit such as the Pirahna model or make a kit version of same. In my case I have a kit version which electronically isolates the batteries so that you can flatten the radio battery without affecting the starting battery. I have used this system on my Jeep and it works very well.

(Easy way) Since the radio battery is in the back of the car, I feed it from the main battery with some seven core caravan cable (at least we call it that in VK). I arrange it so that I can select from 1 to 7 cores in parallel and then adjust the number of cores used to give a charging current of about 5 amps maximum. As the battery ages, you may need to increase the number of paralled cores to compemsate for the increase in internal resistance in the battery. When you are stationary and transmitting, you are in fact taking some energy from the starter battery, but because of the resistance in the caravan cable between front and back of the car, this is minimal and not of concern. If you camped overnight, then it is a simple matter to unplug the caravan cable at one end (I have a simple switch).

I currently use the easy system and find no disadvantages over the harder and more expensive system.

I thoroughly endorse the comment about having the battery and radio earthed right onto the chassis. This, coupled with the use of toroids on all leads going to the FT100 main unit from the remote head, speaker, mike, key etc. ensures that the radio remains at very close to zero RF potential at all frequencies.

The battery I use is a deep cycle 90AH model. Very reliable and an excellent match for the 20 amp peak currents required of the FT100.

I occasionally hook up a MA1000 solid state amplifier as well, but the 80 amps peak plus the 20 amps from the FT100 is better suited to a normal battery which can better deliver the higher peak currents.

Cheers

Are you using a Pathmaker Batt Combiners? Perhaps this link will come through:
http://www.westmarine.com/cgi-bin/ncommerce3/ProductDisplay?prmenbr=201&prrfnbr=7468&outlet=

I forgot to mention the problem of having the radio battery try to start the car. When you crank the engine, the main battery voltage can be pretty low and can lead to a reverse current path from the radio battery.

No, it's not one of the Heart units, although that would certainly be a
good selection. I'll have to go pop the hood and get the name off of the
thing. The one I have is solid state 70 Amp unit, but is not a simple
diode isolator. It does cycle according to battery voltage.

> I forgot to mention the problem of having the radio battery try to start the

Exactly why the charge controller/combiner is important. Even the cheap
diode units would provice that kind of protection, but they have some
voltage drop and don't operate based on voltage of the secondary battery.

From: Ignacy Misztal
Topic: 5333 Message: 5333

I am getting varying audio reports on my FT-100, some of them very good, and some of them saying "scratchy signal". 20m seems to be the best. In a portable situation with long wire antenna, adding ferrite on the power cable improved the signal quality. It looked like some of the feedback was through the power cable. When I monitor the FT-100 on another radio, I can here some scratchiness. It disappears when I talk to the microphone from 4 inches or more but at that point the RF power bar barely moves. Not sure whether the problem is general or just with my radio.

If someone has a good oscilloscope and questions the audio of FT-100, it may make sense to look at the RF signal. If there is any clipping or oscillations, they will be seen on the RF signal.

73,

Ignacy, NO9E

OK, let's stop the moaning and get some good threads going again. Some have way too much time on their hands to complain. Let's work together as the hobby is intended-to bring smiles to everyone. Experiment and try new things. I've had downs with the FT100 but hey it's up and running and doing well.

I'm curious on PSK31 and how everyone is doing with the FT100. I just set my unit up last night and started receiving signals, but didn't get to try xmit yet. I'm using a new program Winwarbler which allows three signals at once to be received. I purchased, as opposed to building the interface, for $39. Couple plugs to the computer and one into the data port. Wow! Up and running in minutes. I was impressed. Was on 20m at 0500, band was dead. BUT, low and behold once you tuned to 14071 there were a number of qsos taking place.

If anyone is interested I'll forward the email address for the FREE software download and email address of an outfit providing interfaces for next to nothing for most rigs and he includes PSK31 software!

GO hobbiests!

I had received reports that my audio had distortion on it too. The
gentleman I was speaking with said that it sounded like RF was getting
back into the radio.

I went to Radio Shack here and just picked up a few RF Chokes and a
little snap-on ferrite core. I put two RF chokes plus the snap-on
core on the external speaker lead as well as the microphone lead,
both right as they enter the radio. For the time being, I left the
remote-head cable with just it's standard core that it came with.

Last night I made a contact on or about the same frequency that was
giving me problems the other day, and got a clean bill of health for
the audio.

I will continue to check this out and see how the audio is sounding.

Thanks to those list members who sent me e-mail messages to confirm
my hunches that this action might result in resolution of the problem.

Newmar makes a battery isolator that uses relays also. Should be available
from most marine stores.

5338. PSK31 and Winwarbler program

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-02 15:52:25 UTC
From: gerald.kopstein@us.ul.com
Topic: 5338 Message: 5338

Based on my earlier posting their appears to be interest in using the FT100 with this new software. By the way it was discussed in the latest issue of 73 magazine if anyone is interested.

The program can be gotten from www.qsl.net/winwarbler/.

Anyone looking for hardware to work PSK31 with the FT100 (or most other rigs) go to www.packetradio.com/PSK31.htm/. Very cheap and delivers in a day or so.

And, once I got my interface unit from the site above, I ran into the problem that my computer was too far away from my rig for the cables to reach. I was about to put adapters in the audio and DB9 interface cables to make them reach when I ran into an easy fix. You can purchase the cheap mouse interface cable, which just happens to be a mini type that plugs right into the FT100. Our wonderful Best Buy store has them - male to female - perfect to connect to the FT100 data port! That way the interface box can be located near the computer keeping cables short - less possibility of rf interference - and run one cable to the FT100 data port.

Like I said earlier I have been able to receive, but have not played enough or read all manuals with the winwarbler to transmit.

I'd be interested in hearing of others attempts, tricks, things to know, etc. Such as are you running the FT100 in USB or do you use the DIG mode instead? Winwarbler advises to use USB mode.

Good luck everyone. What an easy way to get into a new mode of operation. Look forward to hearing you on PSK31.

Topic: 5339 Message: 5339

I got the FT-100D back from its second trip to Yaesu yesterday, I am happy report that they managed to fix it(HiSWR). Now to those who say that people like me are spreading BS, or as some polls suggestions suggest that any one with a broken radio is an idiot and cant set up his rig right----I have not changed my station set-up, but rather Yaesu fixed the problem. No ferrites wrapped on every cord, no monster ground straps and no change in coax length(one of which is 125' long and hooked to a beam 60 feet up). To the one who offered me 10¢ on the dollar, you really know the true value of this rig, in new, out of the box condition.

I would suggest any one with intermittent or worse HiSWR problem to make Yaesu fix it right away. Maybe the volume of rigs getting returned might convince them to fix it right so the next chap down the road doesnt have to spend 3 months after a purchase trying to get their rig to work.

Yes, this rig has left a bad taste im my mind. I hope I can use it and enjoy it now that it works. So far so good! Shame on yaesu, they can and should do better with there products. To all those who get rigs that had no problem, I am happy for you.

My complaint is simple. If there is a design change to fix this problem,
then change the radio before it leaves the factory.

So what did they say they fixed?

just unboxed my new ft-100. Installed a new mobile antenna on the Mazda truck. Have managed to tune 40 meter whip alright, but I grounded everything I could find first (bed to frame, frame to motor, rig to chasis, battery direct to rig, etc. and a ground strap to the mount of the antenna just for good measure). Am tempted, though, to bring it inside and hook to known good antennas just to see how it behaves.

5344. Battery Isolators / Circuit Breakers

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-03 15:51:14 UTC
From: Powerwerx
Topic: 5344 Message: 5344

Recent thread has been about battery isolators (marine type). These are good if you are running a second battery and don't want to draw down the main car battery.

BUT, I was wondering how many people install a Manual Reset Cuircuit Breeaker in their vehicle.

Most commercial radio installations specify at least one heavy duty circuit breaker in line from the battery (ususally installed very close to the battery). Some installs put them on each end of the supply line.

If you are like me and have a main distribution line to the rear of your vehicle (SUV) you should think of protection on the line.

6, 8, 10 gauge supply wire will draw a quite a few amps if shorted out.

We sell a heavy duty 70 amp Manual Reset Circuit Breaker in our Mobile Section of www.powerwerx.com. These are not the thermal types that often blow for no apparent reason and can not be reset. Ours are Heavy Duty, have a manual reset lever and do not false.

This should not be taken as that there is no need for individual fuses for each component. In your distribution system as the power is broken out for each device a properly sized fuse should be installed inline.

If you are doing a major vehicle install you may want to think of this extra bit of protection for your power distribution system. Your many installed electronic devices will thank you if there is a problem.

Beyond diodes and relays, there are the types of isolator/combiner units with more complex electronic innards. I have had great success with the BIC 75150 from Hellroaring Technologies (www.hellroaring.com). From their website, they seem to know a lot about batteries. Not cheap, but worth it, at least to me.

Hi Everyone -

I have stayed out of all the crap that just continues to flow through the FT-100 sewer! I had a problem with my FT-100 - I stated my problems hoping I could get some help here and that was it for me.

Now it is getting too personal with people calling others names and degrading them with insults. That is amazing to me! I can see how that would be easy for some as long as they didn't have to look at their target eyeball to eyeball. I wonder if these individuals criticize other CW Ops if nonstandard abbreviations are used such as FR instead of FER for the word 'for'. Guys, these are just emails and no one needs to redline the text. I can expect this type of behavior from my eight and eleven year old grandsons but most of us here expect much more from all those on this list!

Most of our members have treated this last "personal attack" much as we would a jammer on our frequencies. You just ignore them and they will go away. This hasn't happened here -- they haven't gone away! It is time that we cleaned up our act! Period! Let's get back to discussing Amateur Radio and the FT-100 in particular.

It looks like it provides isolation via back to back mosfets, but no overvoltage protection. Gell cells are very sensitive to damage via overvoltage. Still, it is solid state.

Hello all,

Now, may I just please say this. It was never my intention to upset or insult anyone.
There is a good humoured, long standing joke in the UK as to how the Americans have adapted the English language. Similarly there is much amusement in the US with the very British "Jolly good show chaps what ? How about a good cup of tea ?"

I have lived and worked in the US and met the most congenial group of people one could hope to meet anywhere. Because of my accent and the fact that my ears stick out, I was dubbed "Prince Charles" !! The joke on me !

From all this stems the simple fact. Some people have reading and writing difficulties. Some have poor eyesight and have to write using capital letters. We are all different and should always consider this fact and in whatever forum, good humour is essential for sanity. Ever seen the British Government perform in the House of Commons ?

On that score, we this side the pond, eagerly await your decision on November 7th !

Andrew,
G3OUT

I have been using the Hustler Antennas for over 20 years mobile,
with various rigs. Now run 12, 15, 17 & 20 on one mast.
Can't be beat ...

5361. Antenna for use with FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-05 10:48:40 UTC
From: John Shalamskas
Topic: 414 Message: 5361

"Brent" <brent57@...> wrote:

> I'm shopping for antenns. Have never tried HF mobile. Purchased a pair of
> Hamsticks to get me started, but already tell there's better out there.
> Recommendations?

As always, your mileage may vary. Here is a quick look at the ATAS-100
versus a screwdriver antenna. Both are resonant designs that are
remotely tunable. I started with an ATAS-100, but gradually realized
that the screwdriver is the way to go if you operate much HF mobile.
Please reply if there's anything I have missed!

Strengths of the ATAS-100

If you have an FT100 or FT847, the ATAS-100 is a highly automated 40m-
70cm antenna. It is always resonant once it has been tuned, which means
it is efficient for its size. It will tune automagically at the single
press of a button, which is convenient when you are driving down a
crowded highway at a mile a minute. You can manually tweak the antenna
up and down by keying the mic and pressing UP or DWN on the rig
faceplate, which is especially useful on the WARC bands. It is compact
and lightweight enough for use on a heavy-duty trunk lip mount like the
Diamond K400, but make sure that you ground the base of the ATAS-100
with some braid; the K400 mount does NOT provide reliable RF grounding.
The control voltage for the ATAS rides on the center conductor of the
coaxial cable, so there is no need to run motor-control wires to it,
just the coax. The top whip section is pliant enough to survive many
trips into the garage.

Drawbacks of the ATAS-100:

FT100/FT847 requires a duplexor if you use ATAS on both HF/6M and VHF/UHF
No coverage of 80 meters
Noticeably less efficient on 40 meters than a screwdriver
Power rating is only 100 watts
Poor 2m/70cm performance (similar to 1/4 wave)
Loading coil Q is not as high as on a screwdriver
Simple-minded tuning algorithm can easily be upset if tuned manually
Requires you to send a 10w carrier in order to move up/down
TUN button is buried under a menu, which is annoying

Strengths of the screwdriver antenna:

The various "screwdriver" antennas are a high-performance design, and
work amazingly well for a mobile antenna. They cover 80m-10m; some also
will work on 6 meters if you remove the top whip. Some can handle 500

watts or more. They have a large-diameter loading coil that has high Q (high efficiency) and are generally about twice as long as an ATAS-100, which means less inductive loading is required in the first place. They are built a lot stronger than the ATAS. Most people use a trailer hitch mounting. Tuning is accomplished by a dedicated up/down toggle switch on an external control box. You can tune the antenna near resonance by listening to the band noise increase as resonance is approached. This usually is sufficient for shortwave listening. If you want to transmit, send a 10 watt carrier (AM/FM mode, perhaps?) and tune for minimum SWR.

Drawbacks of the screwdriver antenna

No coverage at all on 2m or 70cm (most also do not cover 6m)
Very tall, tends to hit trees and other obstacles
Very heavy, bulky, and somewhat difficult to mount (no trunk-lip mount!)
Tuning requires much more operator attention and dexterity
Control box requires cabling to power and to the antenna motor

John Shalamskas john@...

5362. Just got a used FT-100 ...

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-05 15:29:16 UTC
From: Joe Kazura
Topic: 5362 Message: 5362

Hello,

I have a new/used FT-100.

I have the operating manual, but it has several informational 'holes' in it. I would like to know if there are other manuals that describe some of the on screen "icons".

The only manual I have simply says "The left side of the FT-100's LCD includes a handy Icon display field, which alerts you to many aspects of the transceiver's current operating status."

For example: what is the SWR icon of the ant. with the O?

Can I do direct frequency input via the hand mic keypad?

Where can I find out how to use the scope feature?

Thanks & 73

Joe

5363. RE: [FT100] Antenna for use with FT100

Yahoo group: FT100 (1998 — 2000)

From: Gary Mitchelson
Topic: 414 Message: 5363

What about a multi resonance H.F. whip (Hustler, Diamond, etc) used with a
LDG Automatic tuner?
Would be interested in that comparison. I have the ATAS 100 but I have a
co-worker getting back into Ham radio and wants to go HF/6 mobile.

You don't need a tuner with the Hustler System (unless you run CW/M
or RTTY/M) the B/W is great enough for the phone bands (20 and above).

Subject: RE: [FT100] Antenna for use with FT100

What about a multi resonance H.F. whip (Hustler, Diamond, etc) used with a
LDG Automatic tuner?
Would be interested in that comparison. I have the ATAS 100 but I have a
co-worker getting back into Ham radio and wants to go HF/6 mobile.

5366. Is Good Grounding always the solution?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-05 20:10:30 UTC
From: Hiro Ebihara
Topic: 5366 Message: 5366

Is Anybody instruct me how to proceed?

I have a multi resonance H.F. +VHF whip (Diamond) working with FT-100D for my mobile. 100D works fine for me.

As I have learned from this reflecter, I have tried to get good grounding by putting wide strap between the base of my mobile whip to the chassis of my car.

It results big improvement on 40m and 10m in terms of VSWR, but 6m.

When I had poor(I thought) grounding which had resister of 70ohms between Anntena mount and chassis, I had got almost perfect VSWR on 6m, but after good grounding (I thought) which tells me 0.1ohms at the same condition, I found when I tried to tune ny 6m anntene the length of 6m anntena became very short.
I cut almost 4cm and still VSWR is not as low as I got in previous time. I wonder if I cut shorter or should stop it to re-consider.
At present time, I got two bars on 50.000MHz with FT100D scale and becomes bigger gradually toward higher frequency.
Other mono band whip showes the same result.

It seems to me that it caused by resonance of my car itself.(TOYOTA CAMRI)

Any advice?

Hiro Ebihar/JA1LZK

Hiro:
The target for grounding your antenna on a car is to establish the outside of the body of the car as the "counterpoise" (ground) for the antenna. In othterwords, you want the RF current on the shield of the coax at the antenna mount to flow out onto the outside of the body.
For this reason, it's best to connect that shield directly to the body right were the antenna is mounted. If the antenna isn't mounted on the body, but is instead mounted on a bumper or other separate part, then you need to bond that part to the nearest body panels with short low inductance straps. Also, if the body panels near the antenna aren't electrically bonded to the adjacent body panels, which can happen in some newer vehicles, you'll want to do that also.
I guess what this means is that the frame is often not the best place to establish the antenna's RF ground. This would be particularly true for higher frequencies (like 6M) at which only a few feet of ground strap looks more like an inducter than a ground connection.
Anohter reason to establish the body as the counterpoise is that it tends to keep RF flowing on the outside of the body and less inside where you can get coupling into power, audio, microphone and control wires.

Hi Charle,

Thanks for your comments.
Yes, We have to distiguish between counterpoise and ground.
That is what means to ask. In which we operate mobile, it is very
hard to know if my car works as ground or counterpoise.

I put many bees just below my mobile whip as well as other wires
putting bees just in front of FT100D to separate from outer effects
to see what is caused.

It has no change. It means that I suspect that my car wopks as
counterpoise for 6m.

And then, I do not know how to overcome.

Hello Peter -
My 3.5mm key jack seems to hold quite tightly, and has never worked its way out. I know you tried different plugs, but I will just throw this in anyway. I had one particular molded plug that was so big around that the body did not fit into the recess in the casting. It bumped into the rim and did not allow the plug to mate properly. It seemed like it was plugging in, but was really not bottomed out. I trimmed the molded plug body with a utility knife and the 'feel' of the mated plug/jack was right, with a good detent when fully mated. I should mention that I often use a cut-up molded cable assembly rather than starting with a loose plug and some wire -- it ends up looking much neater, and a molded strain-relief is hard to beat. These have a fairly flexible cord, so there is little tendency for some stiff cable to un-mate the plug.

Same story. B/W is 100 KHz on 40 (from memory, not sure)
KW elements have greater bandwidth. Check their Web Page.

I cannot believe that there has been this much discussion on mobile antennas. I guess there are many people out there that just like to listen when they can. I studied hard{ at birth I knew nothing} & spent my money to talk,therefore ,I use a Texas Bug Catcher. There is no discussion , my mobile talks until I'm ready to listen & then I can hear the people that have been listening. N5BMU CHUCK SCHULTZ

Same story. B/W is 100 KHz on 40 (from memory, not sure)
KW elements have greater bandwidth. Check their Web Page.

Hiro:
I believe the only way to think of it is that you have an RF counterpoise and a DC ground. These are not necessarily the same thing in a vehicle.
I assume when you say "bees" that you mean a ferrite choke of some sort. By putting them on cables going into your radio you reduce the RF getting back into the radio and causing various problems. By putting them on the transmission line near the antenna, you're attempting to "decouple" the outside of the transmission line from the antenna system, which is good. However, you still need a good short RF connection to the metal panels on the outside of the vehicle. If you're saying that you see litle change when you add those to the transmission line, then that would indicate that you do have something acting as a counterpoise (other than the transmission line), which is presumeably the vehicle itself.

Charles,

Thanks for your nice advise.
The 'Bees' that I mean to say was as you described it was a ferrite choke.
I put it into all cables just before FT100D and as you pointed out, I put it just below the feeding point for attempting to decouple the outside of the transmission line from the antenna system.
This reduced VSWR on 10m before I put strap. After putting strap, VSWR does not care if it's on or off.

As you suspect, it might have capacitive or inductive load on 6m.
I will try to put additional coax to the transmission line.

Thanks Charles, for your constrictive advises.

Hiro/JA1LZK.

5374. Re: A different FT100 Problem

Yahoo group: FT100 (1998 — 2000)

From: prforbes@tbsa.com.au
Topic: 5321 Message: 5374

Thanks Ed,

I realise this problem with some moulded plugs - in fact, I have had to do this myself on several brands.

My original post probably does not spell out the whole problem.

The esrth return for the dot/dash circuits is only via a spring tab to the barrel of the plug. With the length of key line (about 4 metres) from the back to front of the vehicle, and the tendency for the plug to move, I find that the keyer circuit will not function properly. It is as if there is a bad connection which can be fixed by a quick rotation of the plug.

I have also noticed the effect on many brands of headphone adaptor/ plug sockets as well.

Perhaps my FT100 socket happens to be a particularly loose one, but I was wondering if other owners had noticed the same effect.

One obvious solution is to run an earth wire from the plug to a screw hole on the FT100 chassis, but given the RF problems that some people are having, I am loathe to try this in case the keyer socket has been deliberately isolated from the chassis.

Cheers

Peter VK3QI

Peter and Ed, good morning,
Yes, I have a similar situation. I have a straight key with a 1/4" stereo plug on it for My FT847. I tried using a Radio Shack 1/4" to 1/8" stereo plug adapter for the FT100. My problem is with a continuous key down condition. I also tried a plain 1/8th" stereo plug "with no wires attached." Same condition, I would plug in the unterminated stereo plug and get the solid Key down effect??? I don't use CW that much in the mobile, but it would have been nice to. I never did feel the detent you mentioned.

Other than that minor glitch, the FT100 radio and ATAS100 are 5X9 all the time on SSB and FM!!!

Good luck and best DX,
73s de John W8JW FN13

Hiro,

The radiation resistance of an antenna is the sum of the radiation resistance of the antenna itself (something like 1 or 2 ohms on a short vertical) plus the RF resistance of the coil and ground (poor ground and lossy coil will make a nice 50 ohm dummy load.) The object is to minimize the ground and coil resistance at radio frequency, so most of your rig's output power goes into the radiation resistance (and eventually into the receiver of a DX station.)

I think you did the right thing - if you check the RF field strength with the ground strap installed, you will find a big improvement compared to your setup without the strap.

The SWR is a separate issue, and can usually be solved by adjusting a matching network at the feed point.

I recommend that you buy Don Johnson's book "Everything You Forgot to Ask About HF MOBILEERING" and read it. Remember, a 50 ohm dummy load has a perfect SWR but doesn't work much DX.

5377. PSK31 operation with FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-06 13:32:07 UTC
From: gerald.kopstein@us.ul.com
Topic: 5377 Message: 5377

Recently I wrote about using the FT100 with the new PSK program winwarbler. I've got it up and running, but only on receive right now. Three signals at once, what a rush! Managed to get the computer to at least key the FT100, but it appears that it is not sending. Maybe only a carrier is going out.

Not sure if I have the FT100 set properly. Can someone give me the exact settings for the various critical aspects of the rig for PSK? I've tried to set the ALC to zero, if that is where it should be? Processor is off. On USB. Power set for 40% (40 watts).

Anyone actually using the winwarbler program? Any special settings needed with the program? Not sure if I have the sound board set either. Hey, when it's not working everything under scrutiny!

Helpful hints anyone.

Thanks, Jerry N9AC

PRAISE for Yaesu and the FT-100
Just have to add my two bits worth. I've had my FT-100 and ATAS just about a year now. The combination has worked flawlessly. I must qualify the use my favorite ever "Mobile Rig" gets daily. First its mounted in a 3/4 ton Chev. 4x4. Second its owner is a Game Warden in Central Idaho. The combination results in a Radio and Antenna that undergoes some of the Harshest Climate and definitely some of the roughest roads and 4x4 trails in the western U.S. The ATAS-100 has worked in 36 below zero tempuratures and the FT-100 has bounced repeatedly to over 10,000 ft elevation in the Central Idaho Wilderness. The Noise Blanker has constantly proven itself against a very noisy Chevrolet. The secret to success on all Bands seems to have been the grounding and groundplane. I'm on the air everyday.....some say this Warden is a workaholic......maybe its just the Shack on Wheels!?!?!?!?!

Just had to get some POSITIVE words out there.

Wow, what an embodiment of the Amateur Code, to be tolerant and helpful of and to others... We are still Amateurs, right, even though this is a different medium? I'd hate to meet someone on the air with such an intolerant attitude. They probably wouldn't talk to me unless I was at least 40db over S9, as it would put too much of a burden on them.

Just as a reminder to all, here is the Amateur's Code:

The Amateur's Code

The Radio Amateur is

CONSIDERATE...never knowingly operates in such a way as to lessen the pleasure of others.

LOYAL...offers loyalty, encouragement and support to other amateurs, local clubs, and the American Radio Relay League, through which Amateur Radio in the United States is represented nationally and internationally.

PROGRESSIVE...with knowledge abreast of science, a well-built and efficient station and operation above reproach.

FRIENDLY...slow and patient operating when requested; friendly advice and counsel to the beginner; kindly assistance, cooperation and consideration for the interests of others. These are the hallmarks of the amateur spirit.

BALANCED...radio is an avocation, never interfering with duties owed to family, job, school or community.

PATRIOTIC...station and skill always ready for service to country and community.

--The original Amateur's Code was written by Paul M. Segal, W9EEA, in 1928.

Well, what you do, is roll out the wallpaper and measure just how much you need for the wall. You then cut it to length and then put glue on the back and stick it on the wall.

Easy :-)

If you are serious, send me an email direct. Will sort you out !

This weekend I was fooling around listening below 160m, around 200-400 kc and heard lots of amateurs talking. I told my friend, who tuned down there and could hear nothing. I figured it was the difference between my 200' antenna and his 75' antenna As I tuned around I could pick up conversations around every 10kc on LSB. Sunday I tried it again, and still could hear guys having a Qso. So I listened, and got the jest of the conversation, then switched to 160, and there they were, up on 160m having this conservation. How am I hearing these guys down below 500kc?

Hi John,

Thanks for your kind advice.
Since, FT100D has no adjustable tuner neither Auto nor manual, I have tried to get closer to impedance of 50ohms by playing with many things that I could imagine.

As you recommended, I will find the book to learn more about mobile setup for optimization.

Thanks again, John.

My guess is that you're hearing image frequencies. The filtering in the FT-100 does not sufficiently notch out the IF image frequencies. If you did the math, you would likely figure it out. (maybe 455 kHz difference ?)
That is one area where the smaller, "gotta receive DC to light" radios don't excel. Even the font-end filtering is not great (no/poor image frequency notch filtering). Granted. the FT-100 isn't the only receiver that suffers from this.

It's not rocket science. Learn (to cut and paste). It can't be too hard to figure out how to highlight text and push "delete" or "backspace". There's no reason to have to print 40 pages when five would have done just fine.

Hi. I just called Yaesu in Cerritos. Seems that in a unit I sent in over the summer, just recently received back after a long parts delay, that the microphone is missing from the box. I spoke to "Bona" who said they would look for it and whether or not they found it he would send me another.

GREAT customer service. This must be recognized publicly.

The bad news is Mike Krueger seems to have left the facility. I hope all is well for him, and it is more than likely Yaesu's loss.

This brings up a good point. When you send something in for repairs, do not send accessories, cables, and so forth. They will only be lost in the shuffle at the workshop. The only time to violate this rule is when the accessory is implicated as part of the problem, in which case you should label it clearly with your callsign or other unique identifier. It is commendable that Yaesu is making good on the lost microphone, it is a relatively expensive item!

Just received an almost new FT-100 in a trade. The main tuning knob seems to be really loose. It feels almost as if it's about to fall off the rig. It works OK, but it's really floppy. The previous owner makes light of the issue. Before I persue this any farther, I need the experience of the group. Is this normal for the FT-100?

Hmmm ...

I just got a used FT-100 from eBay and while the unit is in perfect shape,
the main tuning knob did come off shortly after I got it home!

The easy fix was to gently & slowly pull the rubber 'dial grip' (for lack of
a better phrase) off.

This will reveal a screw hole that accepts a fairly small hex wrench.

Tighten this and thing should be fine - unless the problem has more to do
with the tuning mechanism itself!

As for the loose knob on FT-100, I had the same problem. wasn't actually the knob but was the encoder or pot that was loose on the circuit board. I remember fixing it out in the field with a minimum of tools. I highly recommend you attend to it soon before the loose encoder physically takes out some other component. your milage may vary, hope this helps.

on another topic; will some one send me info how to unsubscribe. tnx.

I'm just a newbie Tech of about a year (kb1emm) and my first rig was a used FT23R HT. I am still VERY impressed by Yaesu's RUGGED quality!

I am a new owner of a used FT-100 (up from a lowly 2M FM ADI mobile unit) and so far I love it!
Some things I like about the FT-100:

☐ I can hook it up to my Macintosh and control it with CAT software.
☐ The FC20 auto ant tuner is $100 less than the comparable ICOM AH4.
☐ The WIDE receive coverage (as you mentioned)

I don't like that I loose the use of the FC20 when controlled by my computer (Mac or Wintel).

I stand by my comment. Consider that they could easily deny that the mic was sent in with the rig. Rather than question this, and accusing me of trying to "get one over on them" he quickly promised to send me one, taking my word for it.

Vendetta ?
Let's start with Yaesu refusing to acknowledge that the FT-100 is a problematic radio. Short of admitting that the radio suffers from a variety of design and production flaws (can you say "recall" ?), Yaesu is trying to quietly handle the MANY problem FT-100s so not to cause an uproar. Granted, who cpould
Aside from being another victim of routinely having to send your FT-100 in to be fixed just after you buy it, my personal bug has to do with the lack of CAT memory manipulation...A huge oversight. One of the other fellows on this group recently approached a Yaesu rep at a show and asked if they would be offering a micro upgrade to correct this. The answer was NO. I suppose that, since I bought it like this, I should have known better or realized that this very important function was missing. (Important...yes ! Manually entering hundreds of memory channels on the FT-100 is a complete clusterf@%#.)

'Taint just us Canucks...MANY of your American patriots are unhappy too. Have a look at the archives.
And just for the record, among other brands of radios that I have, I also own an FT-847 and VX5R for which I'm content with. Yaesu did good on upgrading the micros in the 847 which had some shortcomings. If they have "GREAT customer service" as your desciples claim, then one would expect Yaesu to make their customers happy. Sure, they're fixing the problems but they sure aren't

As far as seeing a micro upgrade come to fruition, I do believe in the addage that the squeeky wheel gets the oil, but according to the closed poll that was taken from members of this group, it seems that I'm one of few dissatified owners. Mind you, that survey was a farce...like conducting a poll at a George Bush rally to see who likes George Bush. Polling a group of FT-100 owners to see who likes it from amongst the FT-100 owners group, (a captured audience) is hardly unbiased, don't you think ?

So you see, I'm having trouble banging the drum and joining the "I love my FT-100" party.

Not to try and defend Yaesu, but every manufacturer has problems with products. I had one with my FT100 shortly after I bought it and they took care of it very quickly (update of diodes in the VSWR circuitry). I've had many other manufacturers' radios also, each one having its own quirks. I do have to agree with you that manually entering hundreds of memories is a royal pain - a feature i didn't fully check into before I bought mine. I also had to be extra careful on bonding in my vehicle, but the results were worth it. Being in the 2-way repair business, I also deal with all the commercial radios. Some of the problems with those, you'd tear you hair out (Motorola using DOS only software, etc)!

Yes, there are shortcomings, but I believe that the Ham community is very resourceful, and can come up with mods for programming, etc.

And the survey - what good would it do to survey people who don't own an FT100? How would they know the good and bad points of the radio?

Vendetta ?
Let's start with Yaesu refusing to acknowledge that the FT-100 is a problematic radio. Short of admitting that the radio suffers from a variety of design and production flaws (can you say "recall" ?), Yaesu is trying to quietly handle the MANY problem FT-100s so not to cause an uproar. Granted, who cpould
Aside from being another victim of routinely having to send your FT-100 in to be fixed just after you buy it, my personal bug has to do with the lack of CAT memory manipulation...A huge oversight. One of the other fellows on this group recently approached a Yaesu rep at a show and asked if they would be offering a micro upgrade to correct this. The answer was NO. I suppose that, since I bought it like this, I should have known better or realized that this very important function was missing. (Important...yes ! Manually entering hundreds of memory channels on the FT-100 is a complete clusterf@%#.)

'Taint just us Canucks...MANY of your American patriots are unhappy too. Have a look at the archives.
And just for the record, among other brands of radios that I have, I also own an FT-847 and VX5R for which I'm content with. Yaesu did good on upgrading the micros in the 847 which had some shortcomings. If they have "GREAT customer service" as your desciples claim, then one would expect Yaesu to make their customers happy. Sure, they're fixing the problems but they sure aren't

As far as seeing a micro upgrade come to fruition, I do believe in the addage that the squeeky wheel gets the oil, but according to the closed poll that was taken from members of this group, it seems that I'm one of few dissatified owners. Mind you, that survey was a farce...like conducting a poll at a George Bush rally to see who likes George Bush. Polling a group of FT-100 owners to see who likes it from amongst the FT-100 owners group, (a captured audience) is hardly unbiased, don't you think ?

So you see, I'm having trouble banging the drum and joining the "I love my FT-100" party.

Topic: 5409 Message: 5413

Just bought a new FT100 (not the D model). I've never used HF mobile, but have been a ham since '72. Any tips you can offer on bonding to a good ground, etc., in the truck (Mazada pickup) would be GREATLY appreciated. I knew going it it wouldn''t be plug and play and I've got a lot of patience. I've got a nice solid antenna mounted directly to the metal of the bed rail just in front of the tailgate, ran a feed line and put a piece of coax braid from the mount to ground on the frame and put in good 1" wide straps from the frame to bed. But I still get next to nothing out power wise. Using A 10 meter hamstick as my "first" antenna. I've tested the rig inside on beams and dipoles and a vertical. checks out fine there. I figure it's a feedline or grounding problem in the trudck and I'm sure in need of your experience.

Subject: Re: [FT100] Unhappy people.

Not to try and defend Yaesu, but every manufacturer has problems with products. I had one with my FT100 shortly after I bought it and they took care
of it very quickly (update of diodes in the VSWR circuitry). I've had many other manufacturers' radios also, each one having its own quirks. I do have to
agree with you that manually entering hundreds of memories is a royal pain - a
feature i didn't fully check into before I bought mine. I also had to be extra
careful on bonding in my vehicle, but the results were worth it. Being in the
2-way repair business, I also deal with all the commercial radios. Some of the
problems with those, you'd tear you hair out (Motorola using DOS only software,
etc)!

Yes, there are shortcomings, but I believe that the Ham community is very resourceful, and can come up with mods for programming, etc.

And the survey - what good would it do to survey people who don't own an FT100? How would they know the good and bad points of the radio?

Brent,
1) Make sure you have the coax connected to the 'HF' pigtail.
2) Make sure you are transmitting on 10 meters some where between 28.3 and 28.5 Mhz.
3) Can you verify the antenna SWR with an external SWR bridge? Maybe the antenna is resonant way out of range.
4) Try listening on 27.185 Mhz AM. You ought to hear a lot of truckers traffic. Can you hear the traffic??
5) can you get a friend to try his radio on your antenna???

6) Make sure the coax isn't pinched along the way and shorting out. Oh BTW, is the PL259 assembled, clean and soldered properly??

5416. Thumping sound in speaker on CW

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-10 10:22:29 UTC
From: Derek Cohn
Topic: 5416 Message: 5416

Dear All,

I've had a problem for a while that I don't believe has been discussed on this list. Please excuse me if this has been covered before.

I have a one year old FT-100. When I operate CW and use the internal speaker for audio, there is no problem. However, when I use either a pair of headphones or an external speaker, there seems to be a thumping sound that accompanies the sidetone during keying. Have any of you heard this? If so, has anyone resolved it?

Thanks for any help you can lend,

73,

Derek Cohn

Derek,

I have not noticed it on my rig, but I suspect it is RF getting back in on the keying line or the extension speaker line. I suggest that you wrap the excess keying line and/or speaker line around those clip apart toroids, or at the very least have a clip on toroid attached if the leads are too short.

Cheers

My guess is you are getting rf on the speaker line (or maybe one of the other cables). If there is rf getting into the radio without the external speaker or headphones, on the small internal speaker this may not be audible due to its poor response as it's so small. Try a clip on ferrite bead on the speaker lead (at the radio end) as an initial hopefully easy fix.
I haven't had this problem with my FT100 but have in the past with various other radios.
Good luck,
Grant, ZL2BK.

I have a 1994 Honda Civic hatchback. Not the most substantial of cars, although better than the small little Metros or other tiny tiny cars.

I have used two mounts. At first I had already put two NMO mounts in the roof of the vehicle for VHF/UHF, so I wanted to leverage them. I went with one of those three-magnet mounts and hooked a very short piece of coax between the antenna mount and the NMO-SO239 adapter on the roof of the car. No worries, it worked very nicely.

Now I have a trunk mount set up, using the front hood of the car, and it seems to work just as well. I have yet to finish a good grounding system with copper strapping, but even what it is getting from the set screws seems to be almost adequate. Go figure, but I know that at 40m it will do perhaps better with a REAL RF ground.

For what it's worth, I'm quite happy with it.

It's not a screwdriver antenna. It is a motor driven, base loaded antenna with fairly low efficiency on most bands compared to other larger antennas. The internal coil is about 3/4 of an inch and is wound with what looks like #22 wire.

Dick,
I have one and love it. It is an amazing antenna. It does not require guying, but it is critical that it have a good/excellent ground. Mag mounts without a ground will not allow the antenna to work properly. Whatever mount you use, make sure it provides a good ground. I use a Diamond k-400 type mount and use an additional braid to the vehicle body(short).

Hope this helps.

I bit the bullet and used a Comet hole mount thru the roof of my new Outback. I did back it up with a 1' square aluminum plate and used 4 3/4" ground straps to the roof beams. 20,000 miles so far and not a single problem. No problem with needing to guy it, it works well at 80MPH. Don't use the hole mounts without reinforcing the roof.

5428. YSK100 Remote kit

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-12 18:34:06 UTC
From: The Simpsons
Topic: 5428 Message: 5428

Hi all.
I have the YSK100 remote kit for mobile use in one of my vehicles, which does the job well except when it comes to removal for use in the shack. The bracket for the head unit has the cable attached so it's just a matter of releasing the head unit and the cable remains. At the radio itself though, the cable is screwed to the unit. Is there some sort of quick release bracket so that the main unit can be quickly removed, leaving the cable behind. I assumed this would be the case when I purchased the very over priced (I think!) YSK100.

Thanks,

Grant, ZL2BK

It may be a bit late for this message, but it was my understanding
that the original beta units had a clone function, however it was
found that users could input frequencies and software modify the
firmware thus the FCC wouldn't type accept the radio. If you recall
when the ft-100 came out Yaesu keep pushing the release date back
trying to fix this problem, but in the end they gave up so they could
get it type accepted and on the market. My 2 Cents.

Take this was second hand information, this is what I've been told.

Has anyone mounted the FT-100 and ATAS antenna
in a Toyota Tundra? If so, can you elaborate on the
installation. Any unique problems?

No troubles here... the mount is a Diamond 400 on the trunk of a
wide track Pontiac Grand Prix.

Dick,
I have one and love it. It is an amazing antenna. It does not require
guying, but it is critical that it have a good/excellent ground. Mag mounts
without a ground will not allow the antenna to work properly. Whatever mount
you use, make sure it provides a good ground. I use a Diamond k-400 type
mount and use an additional braid to the vehicle body(short).

Hope this helps.

Gary,
multi-resonance whips have a lot of drawbacks (large wind load, heavy, questionable mechanical strength, power handling, lower efficiency, poor frequency agility) which lead me to discard them in the quest for an "optimal" mobile antenna on multiple bands. If you own a rig like the FT100, screwdriver antennas are the way to go these days. The problem becomes which screwdriver variant to purchase and how to get the most out of it.

Tell your co-worker that there's a High Sierra design that will do 6 meters if you remove the whip from the coil. See http://www.hsantennas.com/

John KJ9U

Dave,
I run 28.390 almost all of the time. You will find 2 of us there evenings that run FT 100's and both of us are happy as H#$$ with our rigs. Give KG4FET or WH2ATT/4 call on there and one of us will likley come back to you. We also have a net there on Monday evenings at 7:30 pm local(EST, Jacksonville FL) that I am a net control for called the Wackey Wingding net and invite any and all Amatuers to check into.

The only problem is he is installing it in a small Honda he uses for commuting, the HS antenna would be a bit large for his small car.

Thanks for the feedback.

I drive a Honda Civic too! I am putting a screwdriver on it within a couple months. I just installed a class 1 trailer hitch (light duty) for use with a bike rack, so attaching a screwdriver is now a relatively easy step. Just need to watch out for low tree branches :-).

I hear that the best 6m antenna is a California Highway Patrol whip, which can be had from many of the swap meets around here. Or just get a Diamond K400 mount and a 6m-2m-70cm triband whip. You may have some fun getting it to route the signal to the correct antenna, since 6m is on the same jack as HF... perhaps a pair of duplexors could be used to combine the HF-thru-6m and 2m-and-up into one feed, then use a different duplexor to split HF from 50MHz-and-up. Or use a triplexor instead, and split off HF, 6m, and 2m-and-up.

My FT100D AND ATAS100 DON'T WORK FINE. I HAVE 4 TO 5 BAR ON SWR GRAPH.
THE ATAS100 DON'T TUNE ON 40M,21M. IN FM, USB OR LSB (HF) MODE
EVERYBODY CAN HEAR ME FINE BUT IN AM, IN THE SAME FRECUENCY, NOT.
I GROUNDED THE ATAS100 SUPORT TO THE FT100D, TO THE VEHICLE AND TO
THE NEGATIVE BATTERY. I'M USING 30ft OF RG58 COAX AS A LINE.
PLEASE, ANY SUGGESTIONS?...

THANKS...

From: Howard Lester
Topic: 5437 Message: 5438

OM,
I would suggest that the problem may be the need for a direct, short, braid or strap ground from the bottom of the ATAS-100 to a real ground on the car. Most of the mounts, such as those from Diamond do not make even a good DC connection from the base of the ATAS-100 to ground. You must furnish an external ground. Part of the problem is using black anodizing on the mount which does not conduct DC, much less RF. A ground run from the ATAS-100 to the FT-100 means little at RF.

5439. Re: [FT100] YSK100 Remote kit

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-12 19:07:06 UTC
From: Bob Sayers
Topic: 5428 Message: 5439

The message <000c01c04cd7$258c3880$fa8cfea9@simpson>
from "The Simpsons" <grant@...> contains these words:

> Hi all.
> I have the YSK100 remote kit for mobile use in one of my vehicles,
which does the job well except when it comes to removal for use in
the shack. The bracket for the head unit has the cable attached so
it's just a matter of releasing the head unit and the cable remains.
At the radio itself though, the cable is screwed to the unit. Is
there some sort of quick release bracket so that the main unit can be
quickly removed, leaving the cable behind. I assumed this would be
the case when I purchased the very over priced (I think!) YSK100.

Yes, it's so annoying, Grant - and is the same for the FT-90 mobile
transceiver. I'm
not sure whether you can do this with the '100, but I visited a ham
friend yesterday
who was improving this situation with a '90. On this rig, the panel
to which the plug
screws has a further panel behind, which still protects the inside
electronics of the radio.

It's fairly simple to remove the outer panel, and to use this as the
"remote mounting
bracket". The cable between the two is only four conductors, and it's
not too hard to
make up your own extension cable.

Not sure if I understand you, but you say they "can" here you on USB/LSB, but not AM? This is how my rig is. AM IS USELESS! they should have just left it off the radio because it don't work. I have tried all the settings I have seen posted on the net, and lots of my own but the rig "just don't do AM" Don't get me wrong, I still like (most) of my FT-100, but if I had know that AM did not work (AT ALL), I would not have bought it (plus the way it don't here as well on 2m as my $100.00 rig dos'nt help either). Of course, I don't know if AM works on the Icom either?

Hi all

just thought i'd throw an introductory message into the group

i've been after an FT-100 for ages, and so bought one as soon as i passed my UK Novice - Ok, i've had it running for a few days, and must say that i'm quite impressed with it...

good to know that its got quite a large userbase, and that theres plenty of people to share the problems with !

What works for most if you haven't seen it is to cut the hf power output down to about 30 or 40 %.

Will:
Most of the reported AM problems with the FT-100 seem to be due to
having the power up too high or too much mic gain. Also, how are you
listening to the signal to tell if it's working?

mine work great on AM. Also one thing I found with it when I was playing on 10 meters the other day, was that it seems to store a separate power level for am. For instance, I run it at 30 to 35 carrier level (HF power). When I switch to fm, CW or ssb it is at 100. seems like Yaesu left that detail out of their manual.

Gary and everybody else too,
Despite what the book and others in the group here say as well the
ATAS 100 WILL WORK FB ON A MAGNET MOUNT!!! I have run one on a Wilson
1000 magnet and had no trouble with it and WH2AAT/4 runs his mag
mount on a tri mag mount. The antenna will tune all bands to
resonance and can be touched up manually if you hate to see 3 or 4
bars in the display.

And by tweaking the AM Carrier Level (F51) to a higher level (200-225) you
can vastly improve the AM TX audio quality.

Ok, I have received several reports on "mine works great on AM" so,
How about disclosing some settings?
What band are you working AM on?
Power level = ?
Mic gain = ?
Did you go into the F menus and adjust carrier insertion?
Any other menu settings I would need to know?

I have tried to turn up the carrier level to > 200
I have tried to run power levels from 0-50
I have tried to run different mic levels

I am using 2 different friends as a contact. One is on an older tube set, the other is on a new Solid State rig (he has an Icom and Yaesu)

We have tried 160-2 with no luck. they just say it sounds bad.
When I am transmitting on AM, the guy on the tube rig says "it easier to understand you if I switch to FM".

Will R

You can email me off line of you want.

FT100 6M AM audio setup, vastly improves AM TX quality but you must have the 6Khz filter! PO set to 25, Mic gain to 40 to 50 and Carrier Level set to 225 (F51 menu).

If I remember the specs, the FT100 is spec'd at 25W AM. This is how mine is set and works great. Mic and compression levels are set at about 50%.

All,

Remember you are not using normal AM here. You don't have a 50 watt modulator to modulate the 100 watt carrier like in the old days. You are using controlled carrier modulation to simulate AM so you have to start with a lower level of carrier so you can modulate it up to 100 watts on peaks. Of course the best bet would be to use the AM modulation monitor scope on your $10,000 service monitor to set the levels. You do have one, right?

From: g3yhk2@breathemail.net
Topic: 5457 Message: 5457

Hello,
Firstly I want to appologise for my ignorance, I have been QRT for 18 years & forgotten half I ever knew, also the last 18 "in-active" years has produced so many advances that I have not had the opportunity to learn.
My problem is how can I safely tune the ft100 to my aeriel, In the old days, with my then state of the art (valve)ft200, I simply turned down the mike gain, switched to tune, and matched everything up at low power. I am concerned that I don't damage the out-put on my ft100. Can I insert a tone to tune up and is there any other way of doing so at low power other than going to the power menu?
I have a G5RV ant and I look forward to getting back on air and perhaps working some of you people.
Many thanks John

Here is the way I do it with my tuner.

I use the AM mode as the "tune" mode. I have set the carrier output
to around 10 W as i don't use AM. The CW and SSB output is adjusted
to 80%, e.g. almost full output. These are one time adjustments.

In order to tune I select AM mode, key the transmitter, do any
adjustments on the tuner and then switch to full power SBB or CW mode.

Hi,

I have recently acquired FT-100 with ATAS-100 and have FC-20 Auto
ATU that I use on the FT847 homebase.

The FC-20 uses 50 watts to tune and the 10 watts with the ATAS, as probably
most will know.

My question is on the IC 706 their there is a gizmo that that plugs in the
accessory/atu power socket that allows you put the radio in tune mode (by
pressing the tune button) to manual tune you antenna. Does such a gadget
exist for the FT-100, or is it not technically possible ??

As regards the ATAS 100 I have experimented with the antenna with excellent
results (under supervision of a Class A on HF). Near perfect matching 40-10
including the WARC bands (10/18/24), however the SWR was a little high on 6
metres around 1.6:1. The mounting is a Sirio Trunktop II fitted to the
Hatch on the car (a tiny Fiat Seicento). Had similar readings with a large
mag mount base also. Not too sure how the long the counterpoise should be
though.

Up to now, very impressed with both radio and antenna.

5460. which way to ground for power

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-17 04:24:58 UTC
From: Sly
Topic: 5460 Message: 5460

Just wondering... Concerning the best way to ground my radio (for power purposes-not ant/rf reasons).

Is it better to run a heavy (8 ga) ground wire all the way back to the battery or is grounding to the vehicle body just as good? Pro's and con's either way? (I am running a fused 8ga wire for positive from the battery to the radio)
sly

Sly,
Run the power ground from the battery. The original power cord provides for this or powerex.com has connectors. Both lines should be fuse with 25 amp fuses. I use a chassis ground for rf and direct connect for the power in the mobile.

5462. Tune up of G5RV antenna with FT-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-17 11:43:59 UTC
From: Derek Cohn
Topic: 5462 Message: 5462

John,

I was in a similar position as you a couple of months ago and I'll share how I solved the problem with an MFJ-259B antenna analyzer that I already owned.

I use a random length dipole (about 110' long) fed with a random length of balanced line. It's a wonderful antenna and tunes 6M to 160M with a "swinging link" antenna coupler. The center point of the antenna is the TV antenna mast and generates 0 TVI so it's very "neighborly" too!

I put a two position coax switch in the line with the following arrangement:

* Antenna coupler and attached to the common SO-239
* FT-100 attached to antenna 1
* MFJ antenna analyzer attached to antenna 2

Since the antenna analyzer has it's own oscillator, I initially set the coax switch to antenna 2 (substituting the analyzer as the "transmitter") and adjust the analyzer for the frequency I want to operate. I then adjust the coupler for correct SWR (can get 1.1 almost anywhere). I then move the switch to antenna 1 and, voila, the FT-100 sees flat SWR without keying it during testing. If I move frequency or switch bands, I move the switch back to antenna 2, tune the coupler and then move the switch back to antenna 1 for operating

Of course, this is assumes you have an antenna analyzer or want to buy one and they are not inexpensive. However, I find mine invaluable and love using it for all sorts of things (measuring capacitance and inductance of the crystal set components I make, etc.). It's quite a useful item.

Hope this helps!

Have a great day,

Derek

Subject: ft100 - tune-up

Hello,
Firstly I want to appologise for my ignorance, I have been QRT for 18 years & forgotten half I ever knew, also the last 18 "in-active" years has produced so many advances that I have not had the opportunity to learn.
My problem is how can I safely tune the ft100 to my aeriel, In the old days, with my then state of the art (valve)ft200, I simply turned down the mike gain, switched to tune, and matched everything up at low power. I am concerned that I don't damage the out-put on my ft100. Can I insert a tone to tune up and is there any other way of doing so at low power other than going to the power menu? I have a G5RV ant and I look forward to getting back on

air and perhaps working some of you people.
Many thanks John

5463. Tune up

Yahoo group: FT100 (1998 — 2000)

Topic: 5463 Message: 5463

FT-100 has a ALC plug. At 0V, it supplies full power. Going down to -5V, the power drops to 0. You can built a simple device with a battery, potentiometer and a switch to get any power you want by the flip of the switch.

Low SWR of ATAS-100 is no guarantee of its performance. I ran a cable from my shack to a car with the ATAS-100 antenna, and compared reports to a regular dipole. Despite low SWR, ATAS-100 was always a few S below the dipole, and on 40m it was barely heard. This agrees with theory that short antennas with small coils have low efficiency. Still, in mobile situations ATAS-100 may be as efficient or more as other mobile antennas, but it is not a good stationary antenna. When ouside stationary antennas should not be seen, I find that dipoles made of GA 30 wire are very efficient and almost invisible. Their main disadvantage is susceptibility to wind damage.

Ignacy, NO9E

Yes, the wrong place, but I do want to point out that I am surprised that outside the country that folks don't understand that no riots are taking place, much discussion IS taking place, and law is being followed scrupulously if not hastily. And we smile about it.

From: Steve Costelli
Topic: 5474 Message: 5474

Hello All
Has anyone had any problems with the main tuning knob on the FT-100?
Mine has quit working and I can not set any of the radio's settings
ie:pwr out, tone control ect..
Any help or input would be graetly appriciated.
Too late to send the unit back without spending $200.

Steve - make sure you haven't accidentally turned on the "lock" button. I had this happen, and exactly what you described happened to me.

Hi,

Which of you have seen a false SWR icon on 70cm? Can you please step forward ?

Thanks

Tony:

Thank goodness there really is stuff floating around out there regarding the FT-100. I just signed on yesterday and then most of what I've received today is politically oriented. Anyway, get the false Icons on some frequencies on both two meters as well as 440 MHz. I haven't bothered to try to correct it as I don't let it bother me. However, I have read several references to it. 1) Be sure you are VERY well grounded. 2) There are some FACTORY menu adjustments that can be made, from what I understand. I have seen several comments about it on FT-100 sites.

5479. FT100 SWR Icon on 10 Metres

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-19 23:45:16 UTC
From: Tobias Stapleton
Topic: 5479 Message: 5479

I have a problem only on 10 metres with a high swr icon on the FT100. This is present on both antenna systems here, a long wire , tuned using the SG230 and on a Diamond CP5 vertical , the vertical was setup for resonance using the MFJ259 on all bands and even with the addition of the Kenwood AT130 ATU the high SWR icon appears only on 10 metres, with a dummy load (Bird Electronics) attached and power applied on ten no high swr icon appears and full power is sent to the dummy load, any ideas before I send it back to supplier?.
I have no problems on any other Band....

I've had that problem intermitantly on 10 meter SSB only. I think it's a mic plug or ground problem. I can't figure out what causes it, but it struck yesterday for a few mins. and then disappeared! It's pretty hard to troubleshoot something as erratic as that. The last time it struck it was on both 10 and 12, but no other bands. Let me know if you find the cause/cure.

Date: 2000-11-20 00:34:02 UTC
From: Anthony J. Cioffi
Topic: 5476 Message: 5483

Ron,

I know that the problem exists. I know exactly what caused it too. I was putting in a 70cm repeater frequency in VFO-A. I set the entire data set to be stored into a memory bank. But before I stored it, I thought to see if it will work. Just to make sure the tone, offset, etc. was correct. That's when it happened. It has never happened before at all. Then again, I never transmitted a repeater frequency with tone , etc. from the VFO. I am sure there is a software bug in the rig that Yaesu has not debugged. A friend of mine had the same icon and his mysteriously disappeared just as it appeared. Interestingly enough, after I transmit for about 5 seconds the icon goes away. Also, power output does not seem to be affected. I suppose this will warrant some monitoring.

Tony - N2KI

Please, some comment from the Technical Support Team would be greatly appreciated. Thanks

Ron,

I stand corrected. The power output on 70cm is 20 watts max. Unless there is a pot to tweak, I believe I have lost 15 watts somewhere.

Tony

Don't know about 70cm, but I see a SWR indication (rather strong) when transmitting on 144Mhz with 150W & M2 HO loop. Only when the ATAS 100 is on the vehicle tho and connected to the FT 100. It is my understanding that the SWR function is not valid on 144 Mhz & 432Mhz. I am pretty sure it is only the 144 Mhz signals returning to the rig via the ATAS100 which is tuned to a different freq.

Toby,
You have the classic 10/12M FT100 problem caused by poor grounding inside the radio at the HPA to filter interface. The problem is the copper tape used to ground the shields of the coax. Check through the posts and files and you can find the fix, or send it back to Yaesu. My radio also had the problem and i found it was trying to radiate at about 13mhz instead of 28+ mhz causing the high SWR indication.

Thank you Erwin for a brief description of "the SWR fix". I have seen a lot of appends on this subject and I too have the problem in my FT-100. As pervasive as this problem must be, isn't there a service bulletin posted somewhere detailing the fix? Can someone respond with the address of such a bulletin? There are >5000 messages in the FT-100 log. I don't have time to search through all those.

5491. Trying to decide between FT-100 and FT-100D and IC-706 Mk II G

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-20 18:44:01 UTC
From: Bernie Doehner
Topic: 5491 Message: 5491

Hello All:

With AES dropping the price of the IC-706 Mk II G, down to $999, the decision is getting very hard, although I am favoring the FT-100.

A couple of questions..

1. References to good review on the web that compare the 706 Mk II G (specificaly this model), and the FT-100 (specificaly not the D model), and how they compare/contrast?
I am especialy interested in intermod behavior at UHF, but also the 2 and 6 meter ham bands.

2. I have heard that HF AM selectivity sucks, without the optional overpriced crystal filter.
Has anyone measured selectivity without the AM filter?

3. Can 1750 Hz. tune burst be enabled?

4. Is there really no difference in the DSP/noise blanking between the FT-100 and FT-100D?

5. I see from the FT-100D specs on Yeasu's web site, that CTCSS decode now seems to be standard (which it wasn't on the FT-100). What about DCS decode? Is that stock on the FT-100 (without a D)?

Thanks!

Bernie nu1s

Jack and Barry
I have checked the LOCK function and that is apparently not the problem. I have also preformed several resets on the CPU. Still have no control of the radio except from the mic and front panel push buttoms which are limited.
Thanks for the input.
Still looking for a cheap way out.

Steve, initial reaction now is the tuning control is u/s, however you mentioned that there is limited use of the front panel push buttons, which ones work, which ones don't? do the rotary controls (volume, squelch, select) work?

The only long shot I can think of now for a cheap way out is to check the connector between the displat head and the main unit is clean.

You can always check the FAQ at:

http://members.home.com/k0lee/ft100faq.html

It has a picture of the fix as well as a description of the 'High SWR'
problem.

Also, the 'search' function in the e-Groups list works quite well for
finding everything that has been written on a particular subject.

> 2. I have heard that HF AM selectivity sucks, without the optional overpriced crystal filter.
> Has anyone measured selectivity without the AM filter?

The selectivity without the AM filter is poor, say 20 KHz with very wide skirts. Reception of strong stations is fine but weak stations disappear.
>
> 3. Can 1750 Hz. tune burst be enabled?
Not aware although whistling that tone is not a big problem.

> 4. Is there really no difference in the DSP/noise blanking between the FT-100 and FT-100D?

As far as I know, DSP in FT-100 has more functionality. It has bandpass filter in SSB (quite helpful), and 240/120/60 Hz filter in CW (somewhat helpful). Notch in FT-100 isn't very good.

Other advantages of FT-100: better noise blanker, better CW keying, signal equalizers
Other advantages of 706MK2G: better reliability, cleaner SSB signal (in my opinion), SWR sweep.

If I could choose again at the current prices, I would choose FT-100 only because of ATAS-100 and its automatic tuning.

I agree with Kent, you will get intermod with most of the "DC to Daylight "
rigs, since the front end is made to work across a broad spectrum.
There are product reviews on the ARRL web site, in the members area.
If you don't have access we may be able to work something.. My decision was
influenced by the working noise blanker difference.

Hi Rick:

Thanks for writing back.. I heard something along these lines (better noise blanker in the FT-100), but I had lost track of whether it was in comparison
to all 706's, or just the earlier versions.

Also, what I don't know, is this noise blanker separate from the DSP functions?

I am definitely interested in using this rig for HF mobile, but also for
6 meter FM mobile.. I have had problem with other 6 meter rigs, such as
my Midland Syntech, getting badly hammered whenever a diesel driven bus/truck
is anywhere within 20' of my vehicle.

I don't have access to the ARRL site.. Is there a way to get a partial reprint?

Thanks,

Bernie nu1s

P.S. Did the FT-100D improve the noise blanker any over the FT100?

Bernie OM,

DCS: Yes, the FT-100 does have Digital Coded Squelch. From the FT-100 book, "A DCS Encoder/Decoder is built into your Ft-100.....". My FT-100 works quite well on the one repeater in this area with DCS.

IMD: A wide front end is wide open to IMD, too, just as Rick says. There are a few rigs with tuned front ends that track the frequency synthesizer. I believe that the FT-2500 has that feature. I had one older model Azden PC-3000 (?) that was advertised as having that feature. It did work well in some of the "Intermod Alleys" that I have visited.

hello all
I got those question hope somebody can help.

can I upgrade my FT100 speaker to FT100D speaker
also Iam still cant use the MD100 with my FT100 due to adapter any
suggestion.
also still got hight swr icon on 10 meter.. I checked the grounding
everthing is ok.
thnx

5505. Audio and Sidetone

Yahoo group: FT100 (1998 — 2000)

From: Dick Foster
Topic: 5505 Message: 5505

A couple more questions about the FT-100...

It seems like the audio available is less than ample. From their adds it looks like the external speaker Yaesu sells for the rig has an amplifier in it. I use an external speaker to get away from the "tinny" rattle on CW signals that the internal speaker has. Usually run it at full volume. In noisy traffic situations its still pretty marginal.

On a related topic... Is there any way to set the CW side tone level? Looked through the menus and didn't see any. Have not looked at the schematic for a pot. Anyone looked into this? The side tone level is too low in my rig.

Have got some good comments on previous questions. Thanks guys!

Very 73,
Dick W5TA ..._._

Topic: 5505 Message: 5506

Dick,

I am somewhat surprised to hear you say that the audio level is lacking on the external speaker.

My speaker sits next to me in the centre console compartment of my Jeep and even with the console lid closed there is plenty of volume.

Perhaps you need to look at the efficiency of the speaker unit. Is it sealed and/or damped, or open like a reflex speaker? The difference can be something like 1% versus 51% efficency in most cases.

Similiarly, the sidetone level on my rig is fine - just the right level for me either mobile or stationary.

Cheers

Peter VK3QI

In my previous message read 1% versus 5% NOT 51%!!!!

Cheers

From: The Simpsons
Topic: 5505 Message: 5508

I found the audio level rather low as well as I was using an external speaker with low sensitivity in my small Daihatsu 4wd vehicle. Also running 3 other radios as well meant there was a problem fitting all those speakers. I dismantled a pair of small powered computer speakers (with 4" x 2" drivers), fitting them to a small baffle that is a neat fit in the roof after a blank panel was removed (one above the drivers seat, one above the passenger). The amplifier will run off a nominal 12 volts. I used a 9volt 3 terminal regulator to add stability and protection from voltage spikes and it also filtered out alternator whine.
By adding a crude mixer to the amplifier input (10ohm resistors as speaker load for the radio, 33k ohm resistors to the amp input) the audio level can be controlled by the radio audio control as usual and there is plenty of level. Being a stereo amplifier, 2 radios were connected to each input. The speakers cost the equivalent of about $US6.00, and I have a small mains power transformer left over! If you have the room, use larger speakers for better results.
Another option I have used is to feed the audio into the car audio system. This requires modification of the car audio system which can be difficult, but the results are excellent.

Hope this helps,

Grant, ZL2BK

are a few rigs with tuned front ends that track the frequency synthesizer. I
believe that the FT-2500 has that feature. I had one older model Azden
PC-3000 (?) that was advertised as having that feature. It did work well in
some of the "Intermod Alleys" that I have visited.

Looked through the menus and didn't see any. Have not looked at the
schematic for a pot. Anyone looked into this? The side tone level is too
low in my rig.

5510. Re: [FT100] I Wish to unsubscribe from this group

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-22 12:21:56 UTC
From: Lee Devlin
Topic: 5509 Message: 5510

It's interesting how we get a lot of unsubscribe requests whenever someone posts an inappropriate off-topic message which generates a flurry of responses. So let's resist the temptation to either post or respond to such postings in the future.

I've update the FAQ section related Unsubscribing:

Unsubscribing from the FT100 eGroups list
Are you tired of getting too much email from the list? There are now several choices. You can subscribe to the digest which compiles a single email of all the daily activity on the list and sends you a single email to read instead of one for each subject. This makes it harder to respond to a single subject because you have to edit the subject line and a large portion of the body of the message, but might be more convenient if you spend most of your time reading rather than posting to the list. Also, if you go on vacation and don't want to wade through a pile of email when you return, you can suspend the email for as long as you like and still be able to read it from the eGroups FT100 web page. You can still post questions, see responses, access files, and search the archives. Go to http://www.egroups.com/subscribe/FT100 to see how to do this.
If you really want to quit, just follow these instructions:
You can unsubscribe from the FT100 list by sending an email containing the message:
UNSUBSCRIBE
from the email address where you receive the messages. The word UNSUBSCRIBE is all you need to have as the body of the message. There is no need to have a subject line.Send it to:
FT100-unsubscribe@egroups.com
PLEASE NOTE: THE ADDRESS SHOWN ABOVE IS NOT THE SAME AS THE MAILING LIST ADDRESS which is FT100@egroups.com. Sending an unsubscribe request to the mailing list address does nothing except forward it all to all recipients.

From: Lee Devlin
Topic: 5505 Message: 5511

From the FAQ:

Sidetone/Beep Volume Adjustment

The sidetone/beep volume can be adjusted using VR1004 (labeled VR04 on the board). It is located under the top cover adjacent to the speaker connection. Be very careful as this pot is very small and can easily be damaged.

5512. Good FT-100 audio in car

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-22 13:37:26 UTC
From: Ignacy Misztal
Topic: 5512 Message: 5512

To get good FT-100 audio in car, buy an FM retransmitter (Best Buy, $20). You plug it in FT-100 speaker jack, set car's radio to an unused FM frequency, and tune the retransmitter to that frequency. The advantage is no wires required and ability to use full power of car's radio.
Ignacy, NO9E

5513. What's the deal with not being able to switch preamp off at 144 and 430?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-22 14:09:21 UTC
From: Bernie Doehner
Topic: 5513 Message: 5513

Hi All:

Thank you all for your great input.. Definitely will try to test drive the FT-100 first, assuming HRO
in NH still has one..

One question though... Has anyone figured out how to switch out the pre-amp at 144 and 430 Mhz.?

It seems quite obvious to me, that this radio doesn't deal all that well with intermod, with the
pre-amp always on..

In lieu of this, I assume there is a switcheable 10 or 20 dB attenuator? (I didn't see a mention
of it anywhere). Does this attenuator work at 144 and 430 Mhz. too?

Thanks,

Bernie nu1s

Or easier yet is to buy a "cassette" adapter that is normally used for portable CD players.

5515. FT100 Vs FT100D

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-22 14:52:22 UTC
From: ss409ss@aol.com
Topic: 5515 Message: 5515

The only difference is the larger speaker and added options along with the revision to the firmware for the "W" code problem (FT100D). If there is a difference in blanking or DSP control I dont know. You most likely can match the settings in the sub menu to see if there is any difference between the two.. Does anyone out there with a 100D want to give us the settings from the sub menu so we can match both rigs to whats already been mapped for the 100?
As far as speaker output in the 100, I use a cassette tape adapter in my car stereo. Mine was modified to pass audio to both sides (L & R) and it works great. I even use my graphic EQ in the car for even more control of the audio! You can use a stereo to mono adapter instead of modifying the cassette adapter for mono audio so you dont have to "ruin" its stereo capability. I found a used one that needed a cord so the mod was easy at that point.
My next gig is to add a trailer hitch to my new car for a custom Atas mount. I dont want to put the antenna on my trunk lid. On my older car I didnt give a hoot.. Good luck, Richy

I don't think so.

I just got a FT100D, and it still has the W / U bug.

I'm still debating on whether or not I want to send it in.

I have the mounting bracket kits for both the remote and main unit. I mounted the control head on the emergency brake handle which is on the center console. I plugged in an MFJ speaker which sits on the console facing UP. I have no problem with hearing the audio. Plenty of it. I can still use the emergency brake.

5518. Generic ATAS radio interface

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-22 18:46:46 UTC
From: Dan Hayman
Topic: 5518 Message: 5518

I have been told that there is a group which makes a "generic"
interface for the ATAS 100 which will allow it to act like a generic
screwdriver antenna for radios other than the FT100. I would like to
get the contact information if possible. I will be purchasing the
FT100 and ATAS 100 soon and would feel better about spending the high
price for the antenna if I knew that someday I could use it on other
equipment if needed.

Thanks,

Dan (KD0DAN)

From: Jim
Topic: 5518 Message: 5519

You'd do better with a different antenna. Try modeling the antenna using the ARRL software and you'll find the ATAS100 has low efficiency. It is base loaded and very short.

Is there any way to stick a larger whip/stinger on it, without permanently modifying it? I don't mind if I give up 6 meters by doing this.

The ATAS 100 is still a base loaded antenna using #22 wire on a 3/4
fiberglass coil form. It appears that the losses help it get to 50 ohms.

Dan - or go to: http://amcominc.com/Products.cfm?Man_ID=22 Thier ad in the Dec QST is on page 177 but they don't list the ATAS-100 controller in this issue. It looks like a neat little gadget. If you get it please let me know how it works. The of best of Holidays to you and yours - 73 es God Bless de Denny AD6EZ <>< Goleta, CA [Non-text portions of this message have been removed]

Base Loaded??? The loading coil is 22" up the Large diameter base section, clearly a center load for a mobile antenna. Low efficiency, yes but what mobile antenna isn't, The 3/4 loading section is much larger than a hamstick and the large diameter base really helps out where the current is greatest. Less efficient that a "full size" screwdriver? Yes, but you need to take into account the large capacitance losses of a bumper mount and poor radiation pattern. The ATAS-100 is small enough to be roof mounted (base is 6'6" off the ground on my truck), which makes the best possible radiation pattern and negligible losses due to coupling to the vehicle not to mention getting the antenna up in the air and in the clear (and still not hit highway overpasses). Is the ATAS-100 perfect? Not even close (no 80m for one), but in a mobile situation many other factors are to be considered for many Hams like ease of use and reasonable mounting while still having good efficiency for a mobile.
For many Hams this is the perfect mobile antenna and others not.
So this antenna IS well worth considering (I have worked several Icom 706 owners who have converted to one).
And yes I have excellent signal reports from my mobile.

Dan,

There is a "black box" advertised at
http://www.amcominc.com/productdetail.cfm?Prod_ID=85 for $69.95 that allows
you to use the ATAS with any rig. I believe the commands are something
like12vdc for up, 6 vdc for down and 9vdc for stop or some such.

From: David Hornung
Topic: 183 Message: 5526

For what it is worth & that probably isn't much, I for one am very happy with my FT-100 Atas combo, The only crticism is that the antenna needs a larger lock nut on the mount; it stripped on me & I hand to replace the connector, so I saved the old nut and used both the old & new nuts to make a jam nut far more solid.

Yes and for the record we did get a lot of snow in Buffalo the networks were not exagerating.

Dave Hornung WB2SQR from Buffalo, NY (the Miami of the North only we can count)

Hi Guys,
I also have an FT-100D. What is the W/U bug problem and how do I check for it ?
Thanks in advance,
Roger (N6DVZ)

So let's resist the temptation to either post or respond to such postings in the future. I've update the FAQ section related Unsubscribing: Unsubscribing from the FT100 eGroups list Are you tired of getting too much email from the list? There are now several choices. You can subscribe to the digest which compiles a single email of all the daily activity on the list and sends you a single email to read instead of one for each subject. This makes it harder to respond to a single subject because you have to edit the subject line and a large portion of the body of the message, but might be more convenient if you spend most of your time reading rather than posting to the list. Also, if you go on vacation and don't want to wade through a pile of email when you return, you can suspend the email for as long as you like and

still be able to read it from the eGroups FT100 web page. You can still post questions, see responses, access files, and search the archives. Go to http://www.egroups.com/subscribe/FT100 to see how to do this. If you really want to quit, just follow these instructions: You can unsubscribe from the FT100 list by sending an email containing the message: UNSUBSCRIBE from the email address where you receive the messages. The word UNSUBSCRIBE is all you need to have as the body of the message. There is no need to have a subject line.Send it to: FT100-unsubscribe@egroups.com PLEASE NOTE: THE ADDRESS SHOWN ABOVE IS NOT THE SAME AS THE MAILING LIST ADDRESS which is FT100@egroups.com. Sending an unsubscribe request to the mailing list address does nothing except forward it all to all recipients. 73, Lee Devlin, K0LEE Greeley, CO Visit the FT100 FAQ at: http://members.home.com/k0lee/ft100faq.html ----- Original Message ----- From: "Frank" To: Sent: Wednesday, November 22, 2000 3:26 AM Subject: [FT100] I Wish to unsubscribe from this group > I Wish to unsubscribe from this group > > Frank Hearne

Message: 4 Date: Wed, 22 Nov 2000 08:37:26 -0500 From: Ignacy Misztal Subject: Good FT-100 audio in car To get good FT-100 audio in car, buy an FM retransmitter (Best Buy, $20). You plug it in FT-100 speaker jack, set car's radio to an unused FM frequency, and tune the retransmitter to that frequency. The advantage is no wires required and ability to use full power of car's radio. Ignacy, NO9E

Message: 5 Date: Wed, 22 Nov 2000 09:09:21 -0500 (EST) From: Bernie Doehner Subject: What's the deal with not being able to switch preamp off at 144 and 430? Hi All: Thank you all for your great input.. Definitely will try to test drive the FT-100 first, assuming HRO in NH still has one.. One question though... Has anyone figured out how to switch out the pre-amp at 144 and 430 Mhz.? It seems quite obvious to me, that this radio doesn't deal all that well with intermod, with the pre-amp always on.. In lieu of this, I assume there is a switcheable 10 or 20 dB attenuator? (I didn't see a mention of it anywhere). Does this attenuator work at 144 and 430 Mhz. too? Thanks, Bernie nu1s

Message: 7 Date: Wed, 22 Nov 2000 09:52:22 EST From: ss409ss@... Subject: FT100 Vs FT100D The only difference is the larger speaker and added options along with the revision to the firmware for the "W" code problem (FT100D). If there is a difference in blanking or DSP control I dont know. You most likely can match the settings in the sub menu to see if there is any difference between the two.. Does anyone out there with a 100D want to give us the settings from the sub menu so we can match both rigs to whats already been mapped for the 100? As far as speaker output in the 100, I use a cassette tape adapter in my car stereo. Mine was modified to pass audio to both sides (L & R) and it works great. I even use my graphic EQ in the car for even more control of the audio! You can use a stereo to mono adapter instead of modifying the cassette adapter for mono audio so you dont have to "ruin" its stereo capability. I found a used one that needed a cord so the mod was easy at that point. My next gig is to add a trailer hitch to my new car for a custom Atas mount. I dont want to put the antenna on my trunk lid. On my older car I didnt give a hoot.. Good luck, Richy

5529. CWID with ARTS U/W bug

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-24 02:37:59 UTC
From: Lee Devlin
Topic: 5529 Message: 5529

The U/W problem is related to the ARTS (Auto Range Transpond System) feature. The ARTS feature works like this: Assuming that you and a friend have Yaesu radios that support ARTS, you can set them up to 'ping' each other every 15 seconds with a DCS burst. It the other station fails to reply, it will notify you that the other transciever is 'out of range'. This generates a lot of traffic on a frequency and renders it useless for any other kind of communication. In order to be legal, each transmitter must identify itself every 10 minutes and it does this by sending 'de YOURCALLSIGN k' using CW.

On the FAQ, I have a section on this bug and how to demonstrate it. I have a .wav file of the error sending out 'U's' instead of 'W's'. When I sent my rig back in for updates, I requested that they fix this minor annoyance. It does not affect me because my callsign does not contain a 'W'. Also, I never use ARTS. Come to think of it, I never met anyone who has claimed to use this feature. I can't honestly think of a good use for it. Anyway, Yaesu told me they were waiting on parts to get a fix and didn't know how long it might take. I didn't want to wait to get the rig back so I told them to just forget about it for now. I interpreted this 'waiting on parts' to mean that this is a mistake in an ASIC and not in firmware. Otherwise, I'm sure it would be easy to download the fix into the rig.

The ID is transmitted blazingly fast. I would estimate it at 35 to 40 wpm. You can check it out at:

http://members.home.net/k0lee/ft100faq.html#cwid

So, I have this issue with my rig and many others have it as well but it has absolutely no affect on the ARTS function from my standpoint.

If this really upsets you, consider that ICOM, Kenwood, Alinco, et al., have the nerve to ship radios where this feature isn't even available. :-)

73,
Lee Devlin, K0LEE

IN short form, yes, it is separate, and works very well indeed.
William

Also, what I don't know, is this noise blanker separate from the DSP functions?

> Also, what I don't know, is this noise blanker separate from the DSP
> functions?

The Noise Blanker is in a separate menu (#5) from the DSP functions (#9).
The DSP menu includes the functions for DNR (dynamic noise reduction), DNF
(notch filter), and DBP (band pass filter).

The DSP function also has its own key so you can jump right to it and if any
of the DSP functions are active, the DSP key's backlight is illuminated.

I leave the NB on all the time and it works great getting rid of repetitive
interference such as ignition noise.

Another tip that works on most function keys (like the NB) if you
push the button to turn on the function, and keep the button down
for a second, the radio will take you to the function menu so you
can adjust that level of the option you selected.

I hope your 'custom ATAS hitch mount' will put the antenna up high! Most cars using hitch mounts will put the base of the antenna 12-15" above the roadway (maybe less). Anyone that has ever run mobile will tell you that the RF radiation effeciency increases dramatically the HIGHER you get the base of the antenna above the roadway. I typically run my ant mount at 36-48" up the vechile when using 8' hamstick type antennas (allows for 12' minimum bridge clearance). Mounting on your trunk lid is not the best palce (the roof is) but it will sure beat mounting it down by the trailer hitch!!

Just don't drive down Memorial Drive in Cambridge, Mass.
One bridge has a 9' 6" clearance.
It's great "fun" when some trucker gets lost and roars down
the Drive. What a mess when a 12" truck tries to get through
a 10" clearance !!

Michael, the Mike is proprietary for the FT-100. Bob Heil developed the adapter for it at Yaesu USA's request. You can buy one from Bob at, I believe $24.95 and then you can run the Heil cartridges. I use the HC-5 and love it! The Yaesu mike is Multiplexed!!!!! Therefore you are going to need an adapter. It about drove Bob Heil up the wall to come up with a workable adapter!

Hi all:

Started installing my brand new FT-100 into my car over the weekend and
ran into a few snags..

First.. The hardware (metric screws) in the remote head mounting kit was wrong.
I had 4x the 1.2 cm. machine screws, and none of the 7 mm. screws, of which two
are required to fasten the cable that links the guts to the control head at the
control head end. (At least according to the instructions and my measurements).

Has this happened to anyone else? Did something change? Probably need to beat
up HRO come monday..

The thread of the 1.2 cm. machine screws doesn't even match the thread
of the brass insert in the plastic bracket.

Secondly.. I have never seen the type of connectors Yeasu used on these radios
or the fuse assembly. Is there a way to take the connector/wire apart, so that
there is just wire on one side, and one can snake the cable through a small
hole in say, a car firewall? I have a nack for missing the obvious..
Hope it was that, and not that the only solution is to cut the wire.

Thanks/73

Bernie nu1s

The contacts in the plugs come out. I used a flat-blade screwdriver to depress the plastic retainer inside the shells to release the contacts. Once you've done that, it's easy to fish the wire through a grommet in the firewall. Word of caution: do the wire fishing BEFORE you connect the leads to the battery. Only problem I had was the stock power cord was too short to reach the trunk, and I had to splice in an extension.

Bernie,

Go to Rad Shack and pick up some 10 gauge automotive wire. It is heat resistant. They have black and red. Use that directly from the battery (add fuses in line) and go straight to the rig. I installed mine in the trunk and just bunched up the radio power leads with a tie wrap. Definitely get some Ferrite chokes for the remote head mounting cable and the mic cable extension if you use them. I did the power leads too. GROUND GROUND GROUND GROUND, and a good one too, for your antenna. Pay special attention to that and you will most certainly avoid most of the trouble people have had. Good luck with the install.

Hello Michael,

Read the manual concerning the pin layout at the RJ45 plug/jack of the FT-100. Connect the microfon-PTT through some 47 kOhms to the mic-line and it works fine. If you need the RJ45 Plug at the other end of the mic-cable, go to CONRAD Elektronik and get the tool and some RJ45s. The tool is abt. 40 DM and the RJ45 jacks are sold for 0,25 DM each.

Started installing my brand new FT-100 into my car over the weekend and ran into a few snags..

First.. The hardware (metric screws) in the remote head mounting kit was wrong.
I had 4x the 1.2 cm. machine screws, and none of the 7 mm. screws, of which two
are required to fasten the cable that links the guts to the control head at the
control head end. (At least according to the instructions and my measurements).

I believe they are 2.6mm diameter screws, 7 and 12mm length (?).

I keep losing them. I did find some locally in a pinch. Because they were too long, I used a bit of small hose (imagine heat shrink tubing) just as a huge set of washers might work.

Then, I called Yaesu in Cerritos (1-562-404-2700) and they sent me a BUNCH. Like 3 cents apiece.

I recommend everyone get some as spares, because the act of disconnecting the remote cable from the transceiver in the car is almost guaranteed to result in lost screws.

5550. SWR problem on 2M & When do you know you need the "SWR Mod"

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-27 00:46:19 UTC
From: Dan Hayman
Topic: 5550 Message: 5550

I just spent the day installing my FT100D, Sep kit and the ATAS-100 antenna in my pathfinder. I had to mount the antenna on the spare tire rack in the back. My testing so far shows the radio working well at most ham bands except 145 Mgz. The antenna tunes up and says that it has found a match. However, I get an intermintent SWR X icon (more often then not). It does not apear that the radio is decreasing power when the SWR icon is on. As a side note, I also get this behavior on 10M. What am I missing? When do you know if/when the radio should be sent back for the "SWR Mod?" Is this normal behavior or do I have more work to do? The meter on the radio is not much help in showing me what's going on. BTW, the radio is in "ATAS Mode setting 1."

Any help would be apreciated. I am told that tuning is not needed on VHF/UHF but this does not seem to be the case...

Thanks,

Dan

Dan....try using a separate 2 meter antenna and changing the setting to ATAS-2....the SWR may go away....also use ferrite chokes on the separation cable, the speaker, microphone and a big ferrite donut choke under the ATAS100. I think this may solve your problem. I have had the dual antenna and choke setup for 1 and1/2 years with no problems....Dale KC2PZ

In California, you need to leave one ear uncovered, then you are kosher.

If you want to hack, I'd try to get a plantronics cell phone headset to work. Most PD are used to seeing them by now.

Had the same problem last Jan with my 100 (from HRO). They sent me 2 screw
packs before they had all the correct hardware!
Pretty frustrating!

Hello Michael,

Read the manual concerning the pin layout at the RJ45 plug/jack of the
FT-100. Connect the microfon-PTT through some 47 kOhms to the mic-line
and it works fine. If you need the RJ45 Plug at the other end of the
mic-cable, go to CONRAD Elektronik and get the tool and some RJ45s.
The tool is abt. 40 DM and the RJ45 jacks are sold for 0,25 DM each.

Subject: Connecting a cheap headset

Hi, I'm trying to connect a cheap headest to my FT-100. I have the Heil
adapter, but i need to get 1.5 v to the element. Also, are there any
headsets out there that are plug and play? I'm looking for something that
just has a mic, or one with a single small (earbud) type headphone. I want
to use it in the car, and covering both ears is illegal in Virginia. Any
help would be greatly appreciated!

Subject: Re: Digest Number 605

Started installing my brand new FT-100 into my car over the weekend and
ran into a few snags..

First.. The hardware (metric screws) in the remote head mounting kit was
wrong.
I had 4x the 1.2 cm. machine screws, and none of the 7 mm. screws, of which
two
are required to fasten the cable that links the guts to the control head at
the
control head end. (At least according to the instructions and my
measurements).

I believe they are 2.6mm diameter screws, 7 and 12mm length (?).

I keep losing them. I did find some locally in a pinch. Because they were too long, I used a bit of small hose (imagine heat shrink tubing) just as a huge set of washers might work.

Then, I called Yaesu in Cerritos (1-562-404-2700) and they sent me a BUNCH. Like 3 cents apiece.

I recommend everyone get some as spares, because the act of disconnecting the remote cable from the transceiver in the car is almost guaranteed to result in lost screws.

From: "Dan Hayman" <danhayman@...>
Subject: SWR problem on 2M & When do you know you need the "SWR Mod"

I just spent the day installing my FT100D, Sep kit and the ATAS-100 antenna in my pathfinder. I had to mount the antenna on the spare tire rack in the back. My testing so far shows the radio working well at most ham bands except 145 Mgz. The antenna tunes up and says that it has found a match. However, I get an intermintent SWR X icon (more often then not). It does not apear that the radio is decreasing power when the SWR icon is on. As a side note, I also get this behavior on 10M. What am I missing? When do you know if/when the radio should be sent back for the "SWR Mod?" Is this normal behavior or do I have more work to do? The meter on the radio is not much help in showing me what's going on. BTW, the radio is in "ATAS Mode setting 1."

Any help would be apreciated. I am told that tuning is not needed on VHF/UHF but this does not seem to be the case...

Thanks,

Dan

Subject: Re: SWR problem on 2M & When do you know you need the "SWR Mod"

Dan....try using a separate 2 meter antenna and changing the setting to ATAS-2....the SWR may go away....also use ferrite chokes on the separation cable, the speaker, microphone and a big ferrite donut choke under the ATAS100. I think this may solve your problem. I have had the dual antenna and choke setup for 1 and1/2 years with no problems....Dale KC2PZ

mike,

does this mean that deaf people aren't allowed to drive in virginia??
granted, deaf people don't necessarily have their ears covered, but the net result is similar.

sorry to be off-topic, but you got my curiosity up.

In California, you need to leave one ear uncovered, then you are kosher.

If you want to hack, I'd try to get a plantronics cell phone headset to
work. Most PD are used to seeing them by now.

I think you should look at FCC's Standards, either at ARRL or at FCC, it's legal for a Ham Radio Operator to use headsets, I remember something about a ham op. being stopped by a Mass State trooper, he went to court, and the Judge was not too happy to dismmiss the case!, this was a few years ago, don't remember most of the details. A bit more research should be done with this issue, start with ARRL, they should tell you how this FCC law applies to your area.

Dale,

Thanks for your thoughts. I will try the chokes. Part of my desire for this radio was to avoid multiple antennas. If the chokes do not work then the next question is, How do you know when it is needed to send the radio in for the SWR Mod? I have seen the pix on this, but am not sure how this affects radio behavior or what behavior requires sending the radio in, in the first place! If anybody knows the answer to this, I am all ears!!

Thanks & out to the garage to choke a radio...

Dan

I have a friend who got a ticket from the California Highway Patrol for operating with headphones. Now he knew about the one ear trick, so he wore the headphones with one ear exposed. That was not enough for the CHP, because the capacity to cover both ears was there. You really need something that only has one earphone if you want to avoid tickets.

Topic: 5560 Message: 5560

I just traded for a FT100 (in the mail) and will be using a Astron RS20A for power. I noticed that several months ago there were some messages on using this power supply. Since all the info I've seen says that the FT100 draws more Amps then what the RS20 is rated at, for those that are using the RS20, have you had any problems at full output of the radio or did you cut back on the power?
Second question is the net still in operation and if so what time and freq?
Kurt

Hi All:

It turns out all the kits at HRO in NH were this way!!! After 1 hour of
them trying to make it work for me, I finally got a refund, and they said
they'd inquire..

Sorry, but for $80, I'd expect to have the necessary components to make this
work without modifications..

I am not about to start hunting for metric screws from here, or pay $10 shipping for a 3
cent screw that should have been there from the start.

I haven't measured the regular FT100 mounting bracket, but it should be close
and I want to see if I can't mount the radio directly to the 7" audio rack in
my car, and forgo the remote mounting kit altogether.

Has anyone managed to mount the radio inside a standard 7" vehicle audio rack?

Thanks,

Bernie nu1s

hmmm. I got mine from AES and did not have any trouble. you might give Yaesu an email about HRO, and tell them to get on HRO's case. I have had problems with other equipment I have bought through HRO, so I contacted the manufacture and they got on HRO's case and HRO had it right with in 3 days.

Try this address:

http://www.qsl.net/dl0kp/antennen/ft_100.gif

It works

Thanks! But could you clarify what gets hooked to the left side (at "SW1")?

On the right side I presume is the RJ-45 plug into the radio, left side is the "other" type microphone? So, 9v goes to the pin 2, and the electret mic goes to 8 and 7+5, and the PTT switch goes through the resistor network to the "SW1" point?

How would you connect "up" and "down" switches in this arrangement? Maybe can't? Thanks again

I have a FT100 and ATAS-100 installed in my 95 Pathfinder. ATAS is
installed on the spare tire rack like yours. Radio is under the front seat.
I don't use the ATAS for VHF/UHF ...use a seporate Comet type.
I can tune up on all bands and then some! Ground everything...radio and
antenna mount. All here has been working over a year now. Also some folks
have added longer feed line and that has corrected the problem.
Good luck,
Andy

Hi everybody,

I have had my FT100(not the D) for 5 weeks now and have not stopped having fun yet! It cost here 750UKP - about 1040USD at 1.4USD/1UKP and that was very cheap! The remote kit costs another 55UKP and I have not yet decided if it is worth the price.

Thanks to the e-group some small problems that I have experienced have now been solved but there is still one that I could do with some help with -please!!

The low audio output has been cured by adjusting the IF gain in the engineering functions. The inability to resolve AM has been cured by turning off the 6kHz filter - I still need to find out if this is a fault or not.

However, on 6m FM I have had reports that I TX up to 5kHz LF of the set frequency. I have found that this is related to supply voltage when the engine is off. I am going to run some tests to find at what voltage the rig starts to drift. Has anyone had any experience of this problem? Does anyone know what minimum voltage the rig should operate at (I know what the manual says). Does anyone know if there are any fixes to make the rig more stable at low battery voltages? The feed IS directly from the battery.

One more question, does anyone run the FT100 with an SGC Smarttuner? If so, what type of antenna are you using? Although I am not allowed on HF at present - it is not long to go until access to HF will be code-free:-)

Thanks,
de Tim G8PTP

Your probably getting an intermittent ground thru the spare tire rack (it finds ground thru the hinges). Suggest either another mounting spot, OR a heavy ground braid strap from the base of the ATAS to a GOOD ground on the car body. The ft100/ATAS is know to have all sorts of strange problems when not grounded properly

Andy,

I really think that I have a bad antenna. It seems to tune on 10M at times and at other times, the SWR is at full tilt. Just taping on the antenna seems to change it from good to bad. HRO is going to let me try their demo model and see if it works any better. If it does they will swap with a new one. If not, I guess I need to send the radio in to Yaesu. Yaesu's only response to me (atfer three attempts) is to send the radio in for the mod (something I do not want to do unless it is really needed). I guess I will know tomarow. How did you do your mount on the rack? I had great problems with the diameter of the pipe on the rack. Had to use a "U" bolt and a mirror mount. The mount is then grounded to car via braided wire...

I have been tossing up between an FT817 and an FT100... Decided to put 25% down on the FT100 and will finalise the purchase in a month.

Meanwhile, can anybody tell me where I could lay my hands on a PDF or equivalent manual for the FT100 so I can study up and dream in the ensuing weeks?

Thanks in advance

Greg K

Tim,

I am based in the Uk too, just like you, and I probably got my rig at the sam eprice as you, I just told them to do me a deal with the rig & ATAS-100 for £900.00.

I am yet to even open the box, as my atas-100 is not here yet. How did you set the rig up in the car. I am planning to put the rig in my trunk, as I've got the YSK-100. Is everything easy to set up?

I saw some pictures on the web, I think I might give this a try myself one day. I have got an SGC-230 smarturner on my base station FT-920. I believe you need a short wire foe the SGC. Give it a try, with some wires in your trunk. I reckon a 2.4m wire is recommended, as the shortest, but do check up on that.

Regards,

M1ETW.

Tim,
I have found that at 13 volts the rig will start to loose receive and
will TX low power dispite the meter showing full output. Below 13
volts it does more funny things and the ATAS 100 will not funtion.

If you under voltage the rig or the ATAS 100 you run the risk of killing IC's in either the rig or the ATAS. This is just my experience with undervoltage.

Hi, I tried a SGC230 in my car with the FT100 and various whips. It worked ok on TX loading up on 7 to 30MHz but it was useless on receive.
The problem is that you need the SGC230 outside of the vehicle shell otherwise it picks up ignition interference. In the pictures they show it bolted on the outside of a 4x4 which solves the problem. I now use the ATAS 100 and that picks up no interference. I tried all sorts of earthing but with part of the antenna wire inside the car its hopeless. They state in the manual not to put coax on the antenna terminal of the SGC.
Hope this might save you some trouble.

Kurt,
I ran a Trip Lite 20 amp and overheated it on more then one occassion on both 6 meters and 2 mtr SSB and FM. A fan helped it quite a bit for awhile but I spent 149.95 and bought an Alinco DM-340MV 35 amp pwr supply and that was the best 149.95 I have ever spent. This might be the best Bang for the buck in pwr supplies from HRO. It's a better idea to have more then the rig needs rather then just enough. The FT 100 draws 18 amps at full power on 2 meters so on FM this is at full draw the whole key down and you will overheat a 20 amp supply in a hurry if you are even the least bit long winded. The Alinco has had the fan kick on twice in the last 7 months since I bought it and once was during a 2 meter simplex net I call and once was during a 6 meter contest.

Kurt...

When using the FT-100 in the house, I have an Astron SS-30M switching supply that works just fine. You may want to refer to the QST reviews on switching power supplies printed earlier this year. In the first group of supplies rated, the Astron and the MFJ seemed to generate the smallest amount of RF noise in the group...and they were about the same price. My perception is that Astron was the better buy, plus it had a smaller profile. The Alinco was reviewed in a subsequent article...was a bit more noisy, even though the QST reviewer mentioned a front panel control to "move" noise, and the best street price I found was $40.00 more than I paid for the Astron. But opinions are like belly buttons...ever'body has at least one...and this is mine.

This all being said, about 1994, I borrowed an FT-890 and a 20 amp Astron boat anchor supply and dragged it to VP9-land for a vacation.. It would kick out on voice peaks at full power...my no tech solution was to run it at 80 watts...and sha-zam...nobody ever knew!

BTW Kurt (and anybody else), I have the remote mounting kit and cables for the FT-100 new and in the box...don't need for the Blazer...so make me an offer if you need it.

5582. Holy cow revisited

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-29 13:18:47 UTC
From: ss409ss@aol.com
Topic: 5582 Message: 5582

A sensible Mark Harper writes:

<<<Some of whom seem to reply to the entire digest, making future digests some 60k in length!>>>

Bravo Mark!! This is the second time a whole digest was resent as a quotation.You can make mention of this until you are blue in the face. It seems that people unsubscribe 17 times, quote whole emails, whole digests and then make a three word comment with a 2 paragraph signature (for those that dont know its the silly comments people put at the end of their emails that are usually longer than the email itself).. I know when I get my digest in an attachment form that its gonna be chock full of quotations from the previous digest and not a wealth of new information (like we don't know what the subject is). Now people don't think I am a prude or anything, after all I weathered thru the senseless "FT100 flame wars" about a month ago without making a peep. That in conjunction with the constant disregard for other list members by quoting whole digests and emails is most likely getting to most of the list members.
Please hide your ignorance and quote ONLY the section of the other list members email that you want to make a comment to. HINT>>> CUT AND PASTE, you found this list, I am sure you can find the cut and paste options. If you cant, then do us all a favor and refrain from posting.

Please, to avoid starting a flame war all over again and out of respect for other list members as well as the list owner, send your hate mail directly to me, and dont forget to include the last 3 FT100 digests and quote my whole message above (dont forget to include the email routing information). Just in case I forgot what I wrote about today.. Tnx Richy

5583. Re: FT100 PDF Manual anyone?

Hi All -
Just a mild warning, the "Users Manual" referenced does not quite conform to the way the radio works. It could be disappointing to get all excited about some feature that isn't really there.

These are as submitted to the FCC before release of the radio, probably a very early slightly different version...or are the features there and not documented in later manuals?

5586. Where is the RF ground on the FT100 ?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-29 21:46:30 UTC
From: David Mathieson
Topic: 5586 Message: 5586

Hi,
I have had my FT100 for about 3 months and after running it in the shack for a couple of weeks mounted it in my Toyota Seca, the radio under the driver's seat and the antenna, a home brew tapped whip for 80, 40, 30, 20, 15 & 10M on a home brew custom bracket, similar to a tow bar, mounted from the muffler mounting bolts and to the R/H chassis rail. The base of the antenna is about 400mm above ground level. Power to the radio comes directly from the battery and the power ground is very short and mounted to one of the front seat holding bolts. My control head is mounted on the dash near the steering wheel and the radio bracket is bolted through the carpet, direct to the floor pan. Both the radio and the antenna have very low resistance to the vehicle frame and this set up works very well for me on all HF bands.
My question is, if I needed to connect a separate RF ground from the radio to the vehicle frame, where do I connect to the radio ? There doesn't appear to be a "ground" connection on the set.

5589. "Home" memory button

Yahoo group: FT100 (1998 — 2000)
Date: 2000-11-30 04:30:54 UTC
From: Dan Hayman
Topic: 5589 Message: 5589

Hi All.

Still trying to learn the radio. Question: When I hit the "home memory" button, it keeps putting me into home memory 3. I really want it to default to home memory 1. I just can not get there from here. Even on the mic (I programed the button to take me to home memory), it brings me to position 3 of 4 when I want to go to 1. What steps would I have to take to get the radio to default to home memory position 1?

Thanks & 73's

Dan

Now with a 100D which works 100% with the car mounted ATAS and NO SWR MOD in place!!

David,
The RF Gorund is accomplished via the mounting screws. I run some
1/2 braid wih a connector and i make sure it is between the riga nd
the mounting bracket. I do this on both the mobile and the fixed
station setups.
Best of luck and 73 de KG4FET Sandor

Dales right here, but what he failed to mention is that you must be on the band to get to the home freq for the band. If your on 2 meters it will go to the 2 meter default HOME, There is no way around this but to go to the memory funtion and dial it in from there.

I had the same impression when I was used small-gauge power cables. With better cables, my FT-100 works fine down to about 10.5 V. Works fine from 12V 17 Ah battery at full power.

Mobile, I use cigarette lighter with rather small gauge wires. In Hondas, I need to reduce the power. In other cars, there are no problems when the engine is running. Yes, I know I should be using wires from the battery but in multiple cars this is impractical.

Ignacy, NO9E

From: Ignacy Misztal
Topic: 5595 Message: 5595

The MFJ 4225 power supply gets noisier on 80m and especially 160m. It can also be heard on 6m. When operated portable with partly indoor antennas, the hash can be heard on all bands although mostly it does not strong enough to prevent QSOs. Not sure whether there is any switching power supply on the market with no hash. QST had an article on a design of the switching power supply that had no discernible hash at ham frequencies. One trick was to use slow-switching transistors to decrease the harmonics.

The MFJ supply has very loud fan. I installed a switch to either switch the fan off or run it at reduced rpm via a resistor.

>When using the FT-100 in the house, I have an Astron SS-30M switching
>supply that works just fine. You may want to refer to the QST reviews on

My FT-100 draws from 17 A to 23A depending on antenna and band. The highest requirements are on 6m. It seems that 20A power supply is not sufficient for FT-100.

My Midland Syntech doesn't have a separate ground lug either. What I ended up using, was using the mounting bracket screws, and some 1/2" braid. Made a small hole to pass the screws through, and passed the mounting bracket screws through the holes (with washers on both sides for better electrical contact). I did that at two places on the case.

You can probably do the same thing with the FT100, in my case, the car audio rack seems to be sufficiently grounded, so simply mounting the radio in the rack seems to provide sufficient grounding.

Hi all FT100 owners,
I for one use the SS30M and it works great. No hash on any band. My FT100 actually sits right on top of the power supply with all this sitting ontop of the tuner. makes for a small area taken up for radio. Got to keep the wife happy on too many toys laying around. I keep the cables short. Ground leads are run from the tuner and the FT100 to a common bus bar and then a 6AWG lead back to the ground rod for the electrical entry to the house. If found that I need to keep an antenna connected to the VHF input in order to prevent any hiswr occurrences. And that seems to work fine on all bands. Rig works great. Just got into PSK31 and having fun with it on 20 and 10 meters. Come join the crowd on 14070 and 28120 if you are using the FT100 on this mode. Run about 40 watts right now. Work anyone anywhere.

Have fun.

From: justo@maplenet.net
Topic: 5600 Message: 5600

i just read an article in cq mag (july 2000) on the d2t antenna by giovannini elettromeccanica. has a.one used this antenna w/their ft-100(d) and would you recommend this combo for base operations?

for those not yet familiar w/this antenna, it handles 160-2 @1kw pep, is only <20ft long, and doesn't use traps or need a tuner.

thanks,
j

Hi KG4FET,
Thanks for the reply.
I have now found the fault:-(
The in-line fuseholder under the bonnet (hood) had gone high
resistance and decided to melt but the fuse was OK. It has been
replaced now with a 35A fuseholder and fuse-wire. [That will teach it
to mess with me! :-)]

I am not getting the symptoms any more so I guess that was the cause
of the 5k off frequency on 6m.

Hi Darren! G4VTQ

Ok - thanks for the info. I might be OK as I run a deisel. I was
thinking of running a wire from the SGC "live" terminal and havint the
SGC on the roof. The problem there is finding somewhere for the ground
without ruining the paint.

Maybe I should start thinking of a boot lid (trunk) mount with the SGC
outside. I could pick up the ground at the hinge.

I have a friend with the 706mk2G and the ICOM version of the SGC - he has it mounted in the boot and I think it works OK. I will ask him if he has ignition problems.

I am not sure what the YSK-100 is?

I have the whole rig on top of the dash. The rig is sitting in the mobile bracket which is strapped with those elastic straps to stop it coming off when I accelerate!

I have fed the power and the 2 coax under the door frame trim rubber to the boot (trunk) where the HF/6m goes to a 6m loaded 1/4 wave. The VHF/UHF is split with a diplexer, the VHF is fed through a 100W RF amp and pre-amp combination. The UHF is recombined with the VHF and fed to a 2m Halo which also works fine on 70cm.

>
>I saw some pictures on the web, I think I might give this a try
>myself one day. I have got an SGC-230 smarturner on my base station
>FT-920. I believe you need a short wire foe the SGC. Give it a try,
>with some wires in your trunk. I reckon a 2.4m wire is recommended,
>as the shortest, but do check up on that.

OK on the wire length but I was wondering if it realy should be a helical with the tightest turns half way up the antenna (a center loaded wire?). Anything to get the current further up the antenna to improve the effective height. Anybody out there with any ideas?

==========
Thanks for the feedback guys. I will be getting the HF side checked out over the next week to see if the rig has the HF hi-vswr problem...

From: River Rat
Topic: 5602 Message: 5602

I just ordered a FT-100 and an ATAS-100. I currently already have install
in my truck a UHF though the hole mount.

Is the mount strong enough to handle the ATAS-100 under wind load?
I was thinking of running a metal plate underneath.

How should I ground?

Thanks!

Does the FT-100 support CAT control?

The spec. for the FT-100 does not state that there is support. The new FT-817 states there is CAT control.

Is there a standard command set for CAT control?

Can you use a terminal emulator to communicate with the radio?

Any recommended software for CAT control?

Thanks!

Yes.. there are a few programs that do that... depends on what you want to do..

FTBASIC is one that I use often... works great....it controls the rig and also has a small loggin program.

Logger (k4cy) is another I use that works well with FT-100

There are others out there but the 2 I listed are the ones I use most of the time

The other thing is .. you cannot manage your memories with any CAT program

I have used TRX-Manager, a great program, with my FT-100D. The FT-100D now lives in my truck, but I have used TRX-Manager with my FT-757GXII for years. Each radio seems to have a different CAT command set. TRX-Manager supports them all (well, almost all) and can run two rigs, an antenna rotor and web dx-cluster window with automatic QSY and logging features.....

TRX-Manager is certainly worth a look (and the price is right)

TRX-Manager has a control window for entering the bytes of a commond (if you want to)
All of the other features are great..... The only thing lacking is a limitation of the FT-100. There is now way to load the FT-100's 300 memories

I didn't think that my thru-roof mount was good enough. I left may Larsen 2/70 on the thru-roof NMO. For the ATAS-100, I picked up an MFJ Triple-Mag-Mount and used a grounding strap.

See http://kg7il.foxinternet.net/ham/MobileHF/MobileInst.html for my notes...

Hi Folks,

These FT-100s are great radios but some seem to be very sensitive to RF, grounds, types of antennas. Can be annoying because the problem can be intermittent. here is how i fixed my FT-100D s/n 9J101579

Go to
http://www.egroups.com/files/FT100/HISWR+modification/FT100+SWR+Straps.jpg
jump the two offending RF coax connectors with some braid.
spread the braid slightly to allow a screw that is near the speaker to pass through the braid and the aluminum chassis. a little solder
will prevent splintering/shredding the braid. This is one of the screws you have to remove to get the top case off, and is directly next to the speaker.

the general idea is to ground both of these coax connectors. only one of mine was connected/grounded and that was with some tacky copper tape.

success; no more HISWR end of message,
Mike Newbold K0YO
Oak Creek CO

Now that is interesting !! My FT100 is 9J101615, bought in the UK of course and a mere 36 units away from Mike's rig several thousand miles west of here ! Could we read something into that perhaps since the UK cost of an FT100 has fallen dramatically in the last year ? We in the UK have had many cases of "product dumping" in the past, just to rid a manufacturer of their excess production !

However, I agree with the idea of the grounding mod, using the centre case screw but my rig is currently with Yaesu UK who tell me that they have managed to create the HISWR fault on 10/12 metres and following instructions from Japan, have cured it. When I receive it back will report accordingly.

5614. Cooling Problem on VHF/UHF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-03 19:53:58 UTC
From: Daniel Hintersdorf
Topic: 5614 Message: 5614

Hello to everybody,

I'm Daniel from Germany. Since some weeks I'm an proud owner of a FT-100D. But I think my unit has got a little cooling problem:
Using it most time on VHF(145MHZ) I noticed that the unit gets quiet warm also if I only receive. This effects that the signalmeter that works correcly if I switch the unit on shows as lesser strongs of signal as the get wormer in normel receiving(!)-use. The Problem I try to describe is that the fan doesn't starts I only receive also if the unit gets relativly warm/hot. If I press PTT the fan starts an stopps a few seconds after unpressing PTT. This seems to be normal.But this does not cool down my FT-100 on an "normal" room-temperature. So that the signalmeter all the time shows too less signalstrongth on VHF(because the unit is too hot in my eyes in normal use)

Not so HF(0-30MHZ):
There the fan seems to work correcly also in receive. That means if the unit gets a little bit wormer than room-temperature the fan starts cooling up the system upto room-temperature.

Hope this was understandable, I do not mean fan-working depending on pressing PTT. What I'm speaking about is work of fan if the unit gets warm caused by normal receiving. That seems to be different on HF and VHF/UHF.

Does anybody of you know this problem?Is there any setup-solution for it(in the hidden menu?
Perhabs it is depending on softwareversion, but I do not know how I can find out the version of my FT-100D.

so long,
Daniel, Germany

Mike and Tony: I read Mikes note on the HISWR fix on the FT100...I got mine last week and installed the ATAS100 on a 4 foot high tube coming out of a receiver hitch on the back of my 2000 Ford Excursion 4X4. My inital try in tuning the ATAS100 was that 10m and 12m would not tune, nor would 40 meters, even with the Ferrite donut in place under the antenna. I began looking at Mikes jpg on the braid fix. I also bought a AM filter for the FT100 and decide to install it while intending to do Mikes braid mod. I lifted the top circuit board (unsoldered the little green wire) to get the board to fold forward to solder the filter in place. I noticed that the mini-coax sockets on the board go through the board and have a spring tang about 1/2 inch long extending down to make a contact ground with the cast aluminum case. These spring tangs looked colapsed and were not making good contact with the aluminum case. I scaped the end of them and bent them down to put more spring pressure on the case. After finishing the filter soldering (and replacement of the tee-ninesy green wire(thats a technical term)) I looked at Mikes picture again and noticed something different in my radio.(9J101363). I have a coax jumper soldered to a copper tape, but my copper-tape jumper is attached to the coax socket next to the speaker case screw hole, not the one shown shining brightly in Mike's picture. Finally, I put a 10 inch braid between the base of the ATAS100 and the rear door hinge-bolt. To make a long story short (too late) I did not put Mikes braid-mod in but merely screwed everything back together and it tunes fine on all bands. Dale KC2PZ

DAle,

If you look at this enhanced photo (I hope the reflector will pass this), you can see the ground enhancement. When I looked in my rig, I had just the right hand box done. The left side going to the heat sink was not done. That is the coax that I grounded, with braid, to the screw. It fixed the problem. I checked the rig frozen (22 degrees F here in NY Sunday morning) and at room temp and the problem was gone. I'll see how it goes over the next few weeks and the rig gets bounced around in the car from road vibration. If the picture does not come through, I have also sent it to you personally.

Of course you are correct, but you must have a brain and know how to use it. I've done my best to kill that rumor on many scanner and military lists, but it won't die. People have no brains. OK people think. Bill Clinton = big shot. Big shot has a plane at his disposal and thus doesn't need a boat. No boat, no flag issue.

The original of this stupid rumor is Geoff Metcalf, a right wing talk show host. The guy is not known for being factual. In fact, he advertises a drink to help you loose weight while you sleep. Yeah, right.

Now maybe merchant boats will be arriving in Vietnam, and maybe they will have to have the US flag in an inferior position. I don't know, I'm just trying to figure out how supposedly intelligent people fall for this crap.

Sorry for the OT rant, but this nonsense really gets me PO'd.

I have niece that is in Japan right now, that is studing Japanese but sorry she won't be much help. Sometime the different companies would put out a rig that would be used only in Japan for their basic entry class license that would have the same basic design but less power. Maybe thats one of the models shown.

Under Japan Amateur radio rules, they have different classes of
licenses, each class different power levels, radios are made to match
those class licenses, hope this helps.

5624. RE: Cooling Problem on VHF/UHF

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-04 16:28:00 UTC
From: emoxon@alum.mit.edu
Topic: 5614 Message: 5624

Hello Daniel.

I agree that the radio gets quite hot on V/U rx, and it's interesting to hear that the -D model does the same thing as an early original model (9E)

This subject has come up a few times, as early as May 1999.
Back around then, Yaesu tech support said it is normal for the fans to run the way that you, I, and others have seen.
If you experiment, you will find that 70.5 MHz is the dividing line where the temperature control logic changes the way it works. If you let the unit heat up on VHF, then switch to HF, the fans will start. Go back to VHF and they will stop. It is an interesting curiosity that if you have an erased memory (not showing a frequency on the display), the frequency that was there before being "erased" will govern the fan operation. That makes for a funny symptom when you dial thru "blank" memories -- the fans may start and stop and you don't see the reason!

So your radio is working normally, even though it gets hot.

I have wired mine so both fans never stop. They stay at about half-speed except when the control logic calls for full speed.
I think somebody on the list had recently said he had one fan on all the time. That made me think that Yaesu had made a change, but maybe not.
I didn't think of just wiring one fan directly to full power and leaving the other one under normal control. If I had to do it over again, I would try that, since it is so simple.

I have said before that it seems funny that the design allows the radio to get so hot on one band, but not on another.
Well, it gave me some 'enjoyable hours trying to and finally making it "all right"'. (quote from Chuck N5BMU, digest 609).

Still having great fun with a great little rig --
Ed, K1GGI

5628. various settings on the FT100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-04 18:57:20 UTC
From: Fred Davis
Topic: 5628 Message: 5628

Hey all,
Just bought a FT100 and installed it on the weekend. I'd like to pick up on the vast knowledge of the members here about the various settings on the rig. I noticed the defaults for mic gain is 50%, compressor off, etc etc. Just wondering what most folks set theirs up to. Haven't had a chance to do any on-air audio tests yet, but I did bump the mic gain up a tad and turn the compressor on.
What do you other fellas (and gals) set up in your menus?

Cheers de Fred VA3FD

I find the original settings are about the best. Only time I mess
with any of them is on Lower HF, in a pile up, then many be mess
with the EQ and compression.

5631. FT100 output with FC20

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-05 00:30:35 UTC
From: wa8vbx@home.com
Topic: 5631 Message: 5631

I just picked up an FC20 tuner, and when I set it up on 40 meters and tuned it, the output on the FT100 only shows about 60 watts out. The HISWR icon does not come out, but when I use my MFJ 941E it will show 100 watts out on the FT100. On 20 meters I get a reading of 100 watts, on the FT100. I took the cover off the FC20 to pull the battery out to reset it. After that I left the cover off and tried to tune again to 40 meters, same thing. I noticed that the tuning indicator came on the FT100 like it suppose to but same reading as before. I noticed that the load and tuning cap's did not move at all. Has anyone had a similar problem or am I worrying about nothing?

5632. FT100 mod for 220MHz band?

I could be wrong, but I seriously doubt that this would be possible
at all. Even if you get on the frequencies a bit outside of the
intended 2m or 440Mhz bands, you find that performance drops off,
becuase it's not really tuned for transmission there. I highly doubt
that they'd have all the necessary tuning/etc in the radio, and just
"didn't turn it on" and we'll find a magic set of codes to use to
re-enable them.

Just My Humble Opinion.

I'd love to get this info as well if it truly exists.

Also, when you consider the single PA design in the FT100, the finals are capable of about 110 watts in the 220 band.
So far as I've been able to tell (and I DEFINATELY could be wrong) the only thing preventing the rig from transmitting on 220 is the firmware.

Mike

well, I have 2 FT-100D's and both are deaf at 220. with a 5 watt HT neither radio could hear the 220 MHz HT less than 5 foot from the antenna.

Even if you could get it to TX on 220, you better find a receiver for 220, because the FT-100 will not hear anything.

I suspect you'll want to bump the mike gain back down again to 50. I consistently get "loud" audio reports at 50, and I don't generally yell into the mike. It has an excellent pickup despite the very small holes. I do use the processor.

That makes for a funny symptom when you dial thru "blank" memories -- the fans may start and stop and you don't see the reason!

So your radio is working normally, even though it gets hot.

I have wired mine so both fans never stop. They stay at about half-speed except when the control logic calls for full speed.
I think somebody on the list had recently said he had one fan on all the time. That made me think that Yaesu had made a change, but maybe not.
I didn't think of just wiring one fan directly to full power and leaving the other one under normal control. If I had to do it over again, I would try that, since it is so simple.

I have said before that it seems funny that the design allows the radio to get so hot on one band, but not on another.
Well, it gave me some 'enjoyable hours trying to and finally making it "all right"'. (quote from Chuck N5BMU, digest 609).

Still having great fun with a great little rig --

Fred,
I recieved only excellent reports at the factory stock settings. The only time I hear of bad audio reports on the FT 100 is when people try to adjust the processor or start playing with the gain controls. I use the Processor only on AM and adjust the mic qain only on AM as well. The rest of the time no matter what the situation it stays at factory settings. I would play with the MIC EQ settings before you play with the PRO. Good Luck with it and enjoy,73 de KG4FET Sandor Proud owner/operator of the Yaesu FT 100. The deafults are about the best compromise in my FT-100 (9E...). My radio is really sensitive to Mic gain. At the setting of 30, the signal is very linear but not much power out. Settings over 60 create too much scratchiness. Compressor at over 60 also produces too much distortion. I made various tests stateside and DX-side, and recommended settings were sometimes quite different.

The speech processor in FT-100 is quite distorting and ineffective (audio type). One test you can do with it is to whistle while increasing AF gain. After a threshold, the power actually decreases.

It would be interesting to add an outboard speech processors (RF type only). They were manufactured some 20 years ago and still can be seen at hamfests. Judging by comparison with TS-850, which has an RF processor, such a processor would add about 2S. With ceramic filters, the processor could cost only about $20 in parts.

Ignacy, NO9E

5644. FT-100 on 220 MHz

Yahoo group: FT100 (1998 — 2000)

I suspect that 220 MHz works off the VHF PA...
The VHF lowpass filter for TX is probably cutting off shortly after
2 meters, hence little to no power at 220.

Hugh VA3TO

I live 3 air miles from a 220 repeater that runs 200 watts, and have a friend 7 miles the other direction that runs 165 watts. I can tune my FT100 to the repeater output, have my friend call me on the repeater and hear nothing! I mean nothing at all, not even a small noise! I guess it works on paper but not in real life?

I really think all the manufacturers are dropping the ball on this one, it could even increase the value of the radio!

I would love to have 220, plenty of room without keying several different repeaters at the same time (like 2M), and simplex areas that somebody did not stick an "un-coordinated" repeater in (and then they give me hell for using simplex and causing interference to there repeater!. Use it or loose it!

Do any of you have the full schematics from the service manual?

I wonder if it's not possible to add a few components and improve 220 Mhz. receive sensitivity a bit. Also, from the mods I have seen, it doesn't look like transmitting over 174 Mhz. is possible (at least not with the standard Freeband mods).

I believe 220 isn't a common world wide ham band, which is why the Japanese, who dominate the market, don't include it. The west coast has the Condor net on 220, which would be very handy while traveling. To be fair to Yaesu, I haven't seen any multiband radios with 220, just single band radios.

The (aging) Kendwood TM-642 has 2m/220Mhz with an optional third band.
The TM-742 has 2m/440Mhz with an optional third band (220Mhz as in mine).

I believe this is still a "current" model radio, as they haven't
replaced it in the product grid, but I don't think it's being pushed
any more.

I have had fair results listening to 220Mhz repeaters. The one in particular is 30 miles away and runs 25W to a 4 pack of folded dipoles at about 30'. With my dualband mobile antenna it receives as well as a 220Mhz HT with a 220Mhz rubberduck.

You are correct about the 742, but that radio was very modular, To get 220, you lost another band. I don't recall the 642. Would you give up 440 for 220?

Note the new Kenwood TS2000 doesn't transmit on 220, but does claim coverage.

No you don't.

I have 2m/440Mhz/220Mhz in my radio, it's a TRIbander.

The 642 was the same basic radio, except that it shipped with 2m and
220Mhz pre-installed, and you could add a third optional band (like 440Mhz).

The other options were, if I recall, 6m, 10mFM, and 1.2Ghz.

Radio comes with (2) bands, 2m/440, you can add an additional band, 220, 6 and 1.2, 10 meters is no longer available, unless you can get one at a fleamarket. The 642 came with 2m/220, and you could add any of the other bands, the 942, is a 2m/440/1.2, but you couls add another module by taking one of the others out.

Gary,
I think you should contact Kenwood and get the brochure for this radio,
it will describe in detail, "all" the tribanders in this series model
and "all" the options you could have with this radio.

I think it is probably worth resending the results of some measurements on receive sensitivity that I made some time ago. As you will see it suggests something seriously wrong with your system at the time you tried to hear the 220MHz signal.

FT100 Sensitivity

Following the recent queries on FT100 sensitivity, I carried out a few simple sensitivity tests which may be of general interest.
The set up used a good RF generator providing FM modulated at 1kHz with 1kHz deviation and then listening to the received audio for acceptable (!) to find
the minimum RF level at which this occurred. None of the gain or bandwidth controls were touched throughout.
Hence this is only an approximately comparative measurement and my ears need calibrating against a true signal/signal+noise reference before drawing conclusions on absolute sensitivities.

Anyway - I am broadly pleased with the FT100 and its ATAS antenna - even on a small car!
(MHz) (microvolts)
3.5 0.22
7 0. 63
14 0.4
21 0.25
28 0.25
51 0.25
Antenna input change here
75 0.19
100 0.15
120 0.15
145 0.15
220 0.15
430 0.1
440 <0.1
600 0.95
700 9.5 (repeated!)
800 2.5
900 6
950 10
970 14

Comments / queries etc welcome - I will try with an audio power meter sometime!

Perhaps to 'discourage' use on the FRS freqs (462 and 467 mhz)?
My FT8100R has no trouble with output on the FRS freqs, but then,
it's only VHF/UHF capable! ;-)

Hi Folks -

A fellow I know asked an engineer who works for Yaesu about the possibility of making a rig like the FT-100 with 220 capabilities and he was told that the problem with that idea is that a serious of harmonics would be generated by the 220 side that could not be tolerated by the rig. I'm probably not stating this correctly but I know it had something to do harmonics. If this is true then I doubt that there is such a modification for the FT-100.

Hello All,

When I wired my desk mic to my ft100 everything worked ok except for my vox circuit...

Any one have any info about what I might do to get my vox circuit working again??

Thanks and 73!

N2TIF,
Paul

My guess is that you need to push and hold down the PTT button... OR wire the desk microphone so that it passes audio without the PTT button being held down.

Just a guess.

From: Dan Hayman
Topic: 5611 Message: 5667

I am confused and in need of help.

When I forst got and mounted the FT100D and the ATAS, indeed, I experienced all of the problems discussed here and more. In fact, My ATAS was found to be bad and was replaced. For about 2 days, it seemed as if my SWR problems were gone! Indeed, I could find a good match most everywhere & made many contacts on ALL bands.

Now a few days have passed. My ATAS still finds a good match on 10M, but when I transmit, I now get bad SWR readings on 10M. Odd. What changed?

It looks as if I need to send the radio in. Bad. I am wondering if there is a setting on the "hidden" menu which might at least make the radio a bit more tolerant of the problem? Any ideas there? I am also thinking that there might be SOMETHING I could do to help the problem w/o sending the radio in? Any ideas? Very odd--only a 10M problem.

Thanks in advance for any thoughts or ideas. I would like to try all I can before I give up and send the radio in for a mod which it should have had comming off the line...

You all most have it guessed. Mic audio has to be electronically active for the vox to work the radio hands free when you speak and the PTT mic switch must be left alone.

well, I have 2 FT-100D's and both are deaf at 220. with a 5 watt HT neither radio could hear the 220 MHz HT less than 5 foot from the antenna.

Even if you could get it to TX on 220, you better find a receiver for 220, because the FT-100 will not hear anything.

I'd love to get this info as well if it truly exists.

Also, when you consider the single PA design in the FT100, the finals are capable of about 110 watts in the 220 band.
So far as I've been able to tell (and I DEFINATELY could be wrong) the only
thing preventing the rig from transmitting on 220 is the firmware.

FWIW, I've found that "export" versions of Yaesu stuff work much better than the radios intended for the US on out of band signals. My FT50 does fine on mil air, but the domestic versions are dead there. Perhaps those who say their FT100 does fine can also state where they bought it. I know there are a few UK members on the list.

5672. Grounding and 220

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-06 00:01:45 UTC
From: wa8vbx@home.com
Topic: 5672 Message: 5672

I purchased a FC20 tuner and it is not working correctly (Tune Icon comes on but when xmitting only shows 40-50 watts going out). I contacted Yaesu and they said there is a grounding problem and the FT100 needs to be modified so that the tuner works. Other then the mod for the coax is there another mod out there to ground the radio? Also for those that sent the radio in for updates (repairs) what was the turn around time?
For my 2 cents on 220, after reading all the post I checked some of the local 220 repeater and was able to receive one about 10 miles away, with no trouble.

Dan,

This is a subject that has been beaten to death on this reflector. It sounds like the classic problem of the intermittent SWR icon. First make sure that there is no SWR problem on your setup. If you have absolutely made sure of that, then check all of your grounding at the antenna. I don't have and ATAS so I am not sure how it mounts or what the grounding solutions are with it in particular. Also "choke" down all the leads coming out of the back of the rig. After all is said and done, and the problem still exists, it is entirely probable that the grounding problem is in the rig. There seems to be a fix for it. I had the problem on 70cm. Check out this page http://members.home.com/k0lee/ft100faq.html#intermittent . There is a link with a picture of the fix. If you can not see the picture well, I will send you an enhanced version that is more easily visible. But first, check all of the other issues first before diving into the rig.

Good Luck,

Tony - N2KI

FT-100 has 2m and 70 cm filters on receive and transmit. I am not sure whether outside these bands another filter is switched off or the receive filters are very wide.

If after opening the radio there is transmit on 220 MHz, there is a way of getting the band. Eliminate all internal 2m and 70cm filters and add switched external one. This would be a brutal surgery but it could work. Anybody wants to try?

Ignacy, NO9E

Topic: 5677 Message: 5678

I'll give it a try, assuming that it's possible to get the firmware to allow transmit there. All freeband mods I have seen to date, seem to only allow transmit up to 174 MHz. or so. Although I haven't tried the published mods yet.

Another thing I am very interested in, is a way to switch off the preamp on 2 meters and 70 cm., to deal better with intermod, even if I have to do this with a hardware switch.

Those of you with the service manual... How do you rate the quality/depth of the service manual? Was it worth the money?

Thanks/73

5679. 220 band???

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-06 16:25:20 UTC
From: Powerwerx
Topic: 5679 Message: 5679

From what I've been told in the past is that in Japan they use the 220 band for police type agencies and therefore they would never make a radio able to TX under some government law or agreement.

Also, the only other ITU area that uses 220 band is S. America and the market demand for that band (Amatuer use only) is not great.

So I think the ideal of a DC to light transceiver is a little bit away.

5686. Once and for all, is there a specific 220 mod?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-07 23:45:09 UTC
From: Dan Hayman
Topic: 5686 Message: 5686

Once and for all, is there a specific 220 mod? The freeband mod seems to work for some and not for others (including me). Is it a serial number issue or is there some mod or such which will open the radio up (with the understanding that the radio may not perform due to obvious reasons)?

I feel like I am missing something... But that seems to be usual for me regarding this radio...

Thanks.

Dan, KD0DAN

Greetings,
I believe one of the Yaesu tech's, has explained that the FT-100 will not TX on the 220 MHz band?
It was never intended too, (to bad, I could have used this feature) and to do so would require a complete redesign of the rig?
Maybe on the next FT-100 version, it will???
I wonder if Yaesu is LISTENING???
All mode, all band should include 220 MHz!

73-N0ISV-Wayne

From: Dan Hayman
Topic: 5611 Message: 5690

I still feel a bit dense here folks--sorry if I am eating up band width better used for other topics. The question: The braid mod shown here; is it for application INSTEAD of the factory installed "SWR Mod?" Or is this for application after the factory mod has been put in place. If this mod is a replacement for the factory mod, I am a unclear as to just what I would be jumping from with the braid. The pix posted here are good, but I guess I am looking for somebody to spell this out for me. If this is a mod which replaces sending the radio in, I am all for it--as long as I can understand exactly what I am doing (I do understand the concept, just not the steps...).

Again,

Thanks.

Dan

From: Keith
Topic: 5691 Message: 5691

RE the DUP memories (for odd offsets);
1. There are only 20......BOO!
2. The REV (reverse) button doesn't work......BOO!
3. You CAN mix the bands, say TX on 6meters, RX on 440......YEA!
4. You CAN use these memories for SPLIT PL, example TX 127.3, RX
167.9....YEA!
(this trick does not work on the VX-5)
5. You cannot FOOL regular memories by changing the offset, writing the
memory,
then changing the offset back. (This does work on some other Yaesu radios,
though).

Got my year old ft100/fc20 back, sn 9F041xxx. Took several weeks.
Problem was it got HOT as a pistol on the right side within 30 secs of turning
on and had poor tx-rx.
It had also developed a problem tuning 10 and 6meters with the FC-20 (it would
time out with poor tune).
They replaced 2 FET transistors MRF255 and updated the unit, could not find a problem
with the tuner.......
The radio works fine so far, runs cool, (I have yet to test the tuner).

Mine will rx on 220 fairly, no mods. It is about a year old, sn
9F041xxx, USA version. I can receive a repeater 20 miles away using a
144/440 dual antenna. (My 220 HT with a rubber duck receives it a
little better though.)
My experience with other Yaesus is there is USUALLY a mod to let the
cpu ATTEMPT to tx everywhere, although the VCO and other components
limit performance......

I think Mike was describing a mod that was a little different than the picture shows. In looking at the picture of the nrg@ radionet.com modification referenced below, (which I had to access through the 'files' section on eGroups because the link would not go there directly) it appears to be a mixture of factory mod (with the metal strip/copper tape on left) and a substitution mod (done with braid on the right). I can't tell from the pictures if there were any screws added to the side of the casting web. I think the SWR mods may have accumulated with time to include 1, 2, and finally, 3 grounds. The latest factory mod actually makes three attachments to the casting, 2 of them to the coax shields, and one to the flat metal shield which is NOT shown on the nrg@ radionet.com mod referenced below. You can see a picture of the factory mod at:

http://members.home.net/k0lee/factorymod.htm
(be patient, the server has been down lately)

Because it's difficult to drill and tap new holes into the side of the web on the casting, not to mention the metal chips that would result, I believe that Mike is saying that he used the same screw that attaches the metal lid as a way of securing the braid to the casting. If you do this, you should solder and drill the braid to form a sort of 'eyelet' that will be sandwiched between the casting and the lid and the screw would go directly through it to clamp the braid to the casting. I also think that the connection to the flat metal shield is absent in Mike's mod, but that may not have been necessary to fix his problem.

I don't know if Yaesu is applying the HiSWR mods to all radios shipping or only to those that come back in for repair of a HiSWR problem.

Just found the groupe last night...It looks great...

I have something to say about the 220 rx/tx line that I have been reading.

Some of you that have the FT-100 don't ahve any rx on 220 and some of you do have rx on 220....will I'm one of the ones that has the rx on 220...(I don't have a ht or other radio on that band as of yet)

The RX on my FT-100 bought less then a year ago (ser# 9f041xxx)is great. I can listen to 3 different Condor Repeater plus a number of other repeaters that are local and non-local to my location. Now that may be because I have had the mod done to open up the rx and tx (the 2 resistors removed) and that may be why my rx is so good.

I would like to get any mods that may be found for opening up the tx as I don't have the room(nor the cash)in my truck for 3 or 4 different rigs.

Any way enought of that...Great site...I'm glad that I found it...

5700. I'm a happy chappie !

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-09 17:52:46 UTC
From: Andrew Walker (L)
Topic: 5700 Message: 5700

Hi,

My FT100 has just returned from its second vacation in the English county of Hampshire and it now works properly !! Yaesu UK's report says "reset master oscillator and FM TX offset. Tested on antenna, applied Yeasu procedure, retested OK"

Quite what the "Yaesu procedure" is, I know not but have emailed for elaboration. There is no mention of any extra parts fitted. So I took off the top cover to find that the original grounding mod to the HF connector is now surrounded by and soldered to copper tape such that it covers the screw fixing hole in the central rib that secures the top cover, by the speaker. This screw now grounds the lot, it would seem.
There is no additional grounding added to the V/U connector
as in Lee's FAQ photo.

I then removed the bottom cover, never done it before, and found copper tape fixed over some electrolytic capacitors and over a relay. There is also a toroidal transformer hanging above the PA devices that looks as if it has been added as an afterthought, the whole arrangement looking very unprofessional. Not sure if this is a normal adaptation. Perhaps someone might take a look.

The bottom line is that it now a pleasure to use. I can create the HiSWR Icon deliberately of course but there is no unwanted output on 10/12m, hard as I might try. The rig now performs as I would expect. As a bonus, the RF output on most HF bands is now in the region of 115/120 watts.

I'm so happy (so far) that I intend to put it back in its box and give it to myself for Christmas !!!

Andrew,

Good morning to the Group,
After a 3 week hiatus in CA my Ft 100 has come home and boy was I glad to see it. For those of you worried about not getting original box and packing back DON'T be. I sent in my box and packageing in with the suffix of my call marked on it and it all came back except for a nice new bag on the radio. The rig came back doing a couple of new things it never did before (both good mind you).
1. The first and I would say the most important was the fans cycle on U/VHF when the rig is idle. It has never done that before (10 month old rig). One of the concerns I mentioned on my report to Yeasu was the overheating of the right hand rear corner of the rig even when it was idle on U/VHF. Fans will cycle periodically on as it is just sitting by now!!!!
2. 10 mtr SWR icon is gone!!!! I have run it hard on 10 meters the last couple of days during the contest and on PSK 31 as well and it is doing great. I have as yet to run mobile with it where |I was unable to run it at all. I will do that today and let you guys know later today on that.
Invoice stated the following "INSTALLED ALL APLICABLE UPDATES INCLUDING GROUND MOD. NO PROBLEM FOUND WITH RX SENSITIVITY(UHF 16uv VHF 15uV THIS SEEMS TO BE WITHIN YAESU SPEC). TESTED ALL FUNCTIONS AND ALINGED UNIT TO SPECS.
Andrew glad to see your happy with your rig as well on its return from Yaesu service in the UK. Thanks to Yaesu Service in Cerritos CA if (and we know you do) read this.
73 to the group and please join us on the WWD net on 28.390 @ 7:30 EST on Monday nights

Topic: 5701 Message: 5704

Why doesn't Heil wire it up as a direct plug-in for the FT-100. Seems to me that the little 27k resistor could find a home inside that mic case someplace.

Personally, I use the hand mike that came with my FT-1000MP and an adapter that is described at www.w2blc.com (click on the FT-100 link). The mike gets great reports, with comments running towards "almost as good as the 1000MP with the desk mike" and that's not too shabby.

From: John Woika
Topic: 5706 Message: 5707

Joe (KB8BO), first of all the ATAS100 will not auto tune below 7.000 Mhz. The FT100/FT847 circuitry is programmed to stop at 40 meters. If you really need 75 /80 meters, then tune the radio for 7.005 Mhz, next go to the menu and disable the ATAS auto tune feature. Next add about 45 feet of number 16 gauge wire to the far end of the stinger tip. You may need to use an antenna analyzer to determine the correct length of antenna. Find a nice tall tree and hang the long sky hook.

Joe,

There is not enough inductance in the little coil or space inside the ATAS100 to make 80 meters happen.

There are other screwdriver antennas available, but they are not auto-tune, and they are big and ugly!! BTW I use a 75 meter hamstick for the 'few' occasions I really need to listen in on 75.

Good luck & 73s,
de John W8JW
Rochester, NY

As everyone who's tried knows, the ATAS doesn't even manually tune if you are lower than 40 meters. That's kind of unfortunate, because a loaded coil could have been used in place of the existing stainless whip to get on 80 meters!

I imagine some sort of contraption could be made that would allow it... but it's probably just as easy (for me) to remove the ATAS and put a hamstick or other 80M antenna on the car.

Just MHO.

Hi All,

I had asked this back in Nov, but eGroups dropped my
subscription for some reason.

I just found the icon.jpg file in the file section and itshows the HI
SWR icon as Ant. SWR and an X. WHAT is the Ant. SWR with an
O ?

Thanks & 73

Joe Kazura

My apologies for asking a question which has probably been answered over and over. I couldn't find it in the archives however.

Can someone tell me what the difference is between the FT100 and the FT100D?

Is it worth the more than $200 price difference?

5713. Stupid Question - Grounding

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-11 17:48:40 UTC
From: Steven Palm
Topic: 5712 Message: 5713

Okay, a stupid question: Where do you buy the braided grounding strap?

As to the rest, I'm pretty sure it's not a big deal to drill a hole into the trunk mount, and route the strap to a screw on the hood, and then put a strap between there and the fender, the fender and the block, and the block and the firewall, but I just can't seem to figure out where to buy the stuff.

Thanks.

I'm still having BAD reports on 40m, from undecipherable audio (probably, I assume, RF getting back in due to lack of decent ground at the ATAS-100), to almost non-existant signal (same concerns, unless it's just the inefficiency of the antenna).

5716. Re: [FT100] Stupid Question - Grounding

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-11 20:23:12 UTC
From: George Sereikas
Topic: 5712 Message: 5716

Steve,
I already had some, but I think that you can get it from The Wireman(check QST or CQ) and perhaps elsewhere. An easy way to make some is to take the braid off of some RG-8 or RG 8X, flatten it in a vise and add solder to the ends to keep it from fraying.

When you add it to the mount, keep the overall length short as possible. I stuck one end under a portion of the Diamond K-400(the part that clamps to the "lip" and ran the other end to the car body where I added a connector and used a stainless steel screw into the body of the car. I then put some silicone caulk over it to keep the body from rusting. Also, if you're getting RF back into the rig, add some of those clamp-on RF chokes to all of the leads into/out-of the rig. I haven't had to do that, but others report that that is effective. Also, I've found that the rig requires a full 13.8 V. Make sure the car is running when you operate. I've had bad reports when operating off of the battery without the car running(low voltage). I've heard others report the same thing. Low voltage apparently results in distorted audio that sounds like RF getting back into the rig.

Hope this helps.

Regarding the question on where to get braid for grounding you might also check www.cablexperts.com. They sell it in 1/2inch and 1inch wide in various lengths. They are fairly good on price and very quick to deliver.

Date: 2000-12-11 21:27:22 UTC
From: Barry Rimmer
Topic: 5718 Message: 5718

I just got my FT-100 back from Yaeus (stopped transmitting) and I have a new problem. Most of the bands are wrong. For example, 2 meters goes from 144 to 146, instead of 148. What happens is that when I go past 145.99, it goes back to 144.0 Before I get on the phone with Yaesu, I thought I would check with the experts.
Thanks

Topic: 5706 Message: 5723

How about 16 feet.... not 45 feet (there is more coil left when on 40m). I mount a "black widow" fishing rod (of St. Louis vertical fame) behind my ATAS-100 (when I am parked on my 99 F-150 4x4 top & center mount), extend it all but the last section (about 18 ft) and run a 18 gauge wire up it with a alligator clip on the bottom end, and clip it on the ATAS-100 at the bottom of the stinger. I use the auto tune feature to tune this on 20, 30, and 40 meters (cool... and about 1-1/2 S units better on 40). On 80 meters I tune the antenna on 40 meters and go back to 80 meters, reset the FT-100 menu to no tuner or ATAS. With trial and error I know where to go (not cool). The hot setup would be to use the after market control box to match the "BW" whip and wire combo.

73 Cliff N0HC
ps. I also use a 75 meter hamstick when mobile...

Well with the (D) you get about the same fixes as the non (D), however you do get a larger speaker, the XF-117A, 6 kHz AM Filter, and the XF-117CN, 300 Hz CW Filter

As for its worth, here the cost of each and what I think.

First the Larger speaker, I normally run external, but with my (d) I'm happy with the internal, A good external speaker would cost as at least $25(maybe more)

Next lets look at the 6 kHz AM Filter, If you are going to do ANY RX on AM you are going to need this. AM sounds like the pits without it. The XF-117A sells for $79

Finally the XF-117CN, its an ok filter, you CAN work CW without it,however it comes in handy at times and any real cq nut will get one Selling price is $89

Now let tally it all up
EXt speaker $25
XF-117A $79
XF-117CN $89
Total: $193

A difference in $7 is all there really is. Also keep in mind that the filters are installed for you. Hope this helps.

And what's wrong with big and ugly, may I ask? It seems I resemble that remark. HIHIHI!!!!

Seriously, I am saving my sheckles for a High Sierra manual tune, commercial duty "screwdriver antenna". Check it out here:
http://www.hsantennas.com/info/index.html

Here is an edited description from their website:

When properly installed, this remarkably compact antenna provides smooth continuous tuning from 3.5 to 30MHz; essentially
the entire HF spectrum! The typical SWR is less than 1.5:1 across the entire tuning range. This wide tuning range of the
HS-1500MKII is remarkable for an HF antenna. It will also operate on 6 meters (7 to 60 MHz) by simply removing the whip. .
. . . We do not use fingerstock to make contact with the coil. One of our original design goals in 1994 was to eliminate
these troublesome fingerstock coil contacts because they fail over time. Our ?custom decoupler? utilizes a unique torus
shaped stainless steel spring which makes contact with the coil at 120 points. . . . . Over 4000 users have proven this
design. It is simple and very reliable!

It handles 800 watts, more than I want to run mobile. The basic price is $325 but they will make package deals.

I have NO CONNECTION with the company. I was just very impressed with the antenna.

Steven Palm wrote:

> Okay, a stupid question: Where do you buy the braided grounding strap?

Steve, check out the above antenna manufacturer. They also sell the ground braid at $2.50 per foot.

The speaker being larger is the main difference. If you are into
internal audio amplification without any external additions, it might
be worth the $200. I am not.

Daniel,
I hope this anwers your Questions. I just received my FT 100 back
from Yaesu Service in CA. One of my complaints was the same thing
you had with the lack of cooling on U/VHF. On my invoice they had
replaced a thermal switch. The fans now cycle even when idle when on
U/VHF. Rig still stays "warm" but does not get nearly as hot as it
did prior to its vacation in CA. I can't get over how great a rig
this FT 100 is.

David,
It depends on what your operating situation is. The following
options are in the 100D. TXCO high stability oscilator, the CW
narrow Filter, the tone decode board, and a larger Speaker.
I have had no need of the TXCO I run the FT 100 on PSK 31 and it
has not had a problem with drifting yet as it got HOT.
If you are a CW operator the filter is a great option, but with DSP
settings you can almost duplicate what the filter would do and this
would be suffient for the casual operator like me.
Tone Decode board is the only option I would pay for at this time
and it is the easiest to install and the cheapest to buy @ 27.99 US.
Larger speaker is a god thing only if you do not use an external
and I know few people who don't. The speaker in the 100 seems to do
a fairly good job, audio is not as loud as it would need to be in a
high noise area though. I use Motorola speakers both mobile and
fixed station.
73 and I hope this answers the question you posed to the group.

Daniel,
My name is Chuck N5 BMU, I also have the same problem with my FT100. It is now in route to Cal. For a new "thermal control". This problem did not show up until I had been using the radio for about 6 weeks in my truck. I first noticed it on 20 mtrs. ,then 40 mtrs. ; later on UHF & VHF. Turn the rig off for just a few seconds & all would be normal when turned back on , except this time you could actually see & hear the receive going away It would take only about 10 seconds. I am now running the Ft100D mobil to see if it developes the same problem while the FT100 is gone. After using both rigs in the same installation for about one week, I can't tell the difference between the units, receive problem excluded of course. CNUCK N5BMU-----Original Message-----

Save your money and do not buy the ATBK100-it was designed only to provide a better radiation pattern on VHF/6M. It will not do anything for you on HF

A better(and cheaper) soloution is to attach 3 or 4 radials to the antenna. I use mine attached to a metal balcony rail with 4 20' raidials.

Regarding fixed station operation if you go to full size antennas on HF, I find that turning off the attenuator and preamp (the IPO and ATT displays will be "bold") is quite necessary on 160 and 80m, and helpful on 40m. For mobile usage with small antennas this is not necessary, of course. That also would apply to using small antennas for fixed station usage.

As a sidenote. On CW, the factory defaults are for dot = 10 and dash = 30. By ear at 20-25 wpm the on-air signal did not sound quite correct. With a scope the 1:1 dot/space ratio was found at a setting for dot = 13. The 3:1 dash/space ratio was found at dash = 33. On-air reports (and sound to my ear with second receiver) is excellent for those settings. The QSK/break-in then is superior to my FT-990 and a FT-1000D that I had in my station. As a sidenote, the FT-1000MP is excellent on QSK, also.

In case you are wondering, yes I do use the FT-100 as mobile on CW. Many of us do and with excellent results. You may be interested (shocked?) to know that many of the North American large commercial transport drivers are on CW. Their three favourite rigs are the FT-100, IC-706, and one of the Alinco rigs, and in that order. Listen on 3876, 7030 kHz and various places on 20 CW.

Hi folks!
Sorry for asking something that has probably been covered before, however there is such a backlog of mail on this list I think it might take forever to search thru and find the answer!

Is there anywhere that describes how I can build my own version of the Yaesu CT-62 connector cable that includes a level converter?

Cheers

The abk-100 is only useful for vhf/uhf not for HF. You will need some kid of counterpoise for HF, in fact the instructions mention using a mount on a railing for the counterpoise.

5740. Elec Keyer failure-anyone else?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-14 13:14:42 UTC
From: Scott Townley
Topic: 5740 Message: 5740

It seems that the electronic keyer inside my FT-100 has taken
permanent vacation, a sad state since I'm primarily a CW op...
I've checked the paddle connections and made sure I didn't
inadvertantly change the ELEC KEYER setting from EL2...
Just curious if anyone else has had this failure. The rig is mobile
with daily use.
And when I send it back, has anyone compiled a 'laundry list' of
things for Yaesu to update/refurbish or does it work to just attach a
note saying 'bring it up to date'?
Thanks

Actually, I don't think this has been discussed before. The CT62 cable costs $30 so it's just at that threshold where it would be difficult to duplicate its function for less, if you include your time. I once saw a schematic for doing a level shifter for Yaesu HTs and my recollection was that it included about 15 components, mostly resistors with a few transistors. Yaesu's HT cables have all of this done on a small surface mount board that fits in the shell of the DB9 connector housing, making a very neat installation. I can't speak for the CT62 since I don't have that cable, but I assume it is the same board.

Most of the time I see RS232 level shifting done with a MAX232 chip and a minimum number of components, but you'll have to put it in a separate box with a pair of connectors and then use two cables to make a tidy job of it. You could also just splice it into a regular serial cable and tape a ball of electricians tape around it if you're going for the 'I did it myself' look ;-).

If you do decide to make up your own CT62 circuit, lets us know and I'll post it on the FAQ page.

Scott OM,
Although a CW op most of the time, I have to admit to having had cockpit troubles at times and panicked...usually forgetting to put on KEYER, undoubtedly not your problem.

A dealer pointed out to me that the modifications that are in your rig when purchased is indicated by coloured plastic "dots", about 6mm diameter, pasted near the bar graph label on the outside of the FT-100 box. Mine had two of them, which the dealer said indicated that I was not current with the present modifications. He also said that when you send your rig to Yaesu for repairs they would probably not bring the rig up to date unless you specifically indicated that you wanted them to bring the rig up to date with the current modifications.

What are these modifications? I surely would like to know, as well. Mine was "brought up to date with current modifications" but have not the slightest idea as to what was done.

My opinion is that you should spend the $30 on an approved, small and
well-built cable that won't fry your $1000.00 rig.

5747. Fixed SWR Problem (I think)--Thanks to Group

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-14 22:32:34 UTC
From: Dan Hayman
Topic: 5747 Message: 5747

Thanks to the group for all of its support regarding this problem. By looking over all of the posted pix, I took things into my own hands & did the ground mod. In my case, I used solder wick as it seemed to me to be a good size braid to use. It also gave me the ability to "strengthen" the braid where I needed it (just to make sure it did not flop around in there).

What I did was do a run from the coax shield (not grounded to the case by Yaesu) to the internal heat sink per picture. I then did a run to the coper solderd to the case by Yaesu for grounding the other internal coax. It looks a bit like a "zig-zag."

It took 2 tries. The first time it did not "take." The second time, I added a small wire to the ground strap and did a run to an internal screw which holds one of the PCB's to the case. I also routed the solder wick ground strap so that it in now "pinched" near the center hole used by other in this group (the hole which holds the speaker "area" to the case."

Well, it now seems to work. No intermitent SWR icon on 10M (that was the problem child band).

Again, its not pretty. This is really not my field and it took more guts than I thought I had to do this surgery. But the radio now apears to work better & I did not have to send it in. With any luck, I did not mess up anything in there which worked before I got there! Time will tell. The point is that even though its an "ugly duck" fix, it is a fix and there is a certain amount of pride in fixing it myself (with the help of this group).

My thanks to all who helped me with this.

Dan, KD0DAN

Subject: [FT100] FT100 prices

Looking to buy another FT100. Anyone know who has the best price right now, and also what the latest serial number range is. I DO NOT want the FT100D, as I have no need for the TCXO and CW filters. I do want the AM filter and Tone Squech units though, and the difference in price is better applied to those items. I can live without the larger speaker.

Thanks
Eric

5753. Low Pass Filters in ft100.Can they cause high swr?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-15 06:03:00 UTC
From: alan
Topic: 5747 Message: 5753

I have an ft100 and matching Atas antenna.I got my ft100 at Dayton in 1999.The serial number on my ft100 is 9d021xxx.The ft100 worked fine until january 1999 when I went on a trip to Canada and on the way up in the middle of a qso something blew and the rig went dead.I sent it back to Yaesu and they repaired it under warranty.They replaced 26 parts including the 2 fet's,the thermal guard and a number of chips and diodes.The bill came to $336.98 which was covered by the warranty.The rig worked fine until several days ago.All of a sudden the swr icon appeared on all the hf bands except 40 meters.I could only get 50 watts output except on 40 meters where it loaded normally.I never had any problem with the grounding system prior to this in the mobile.I disconnected the Atas and put on a dummy load.The swr was still high except for 40 meters.I called up Yaesu and spoke with a technician.He said the problem seemed to be, from what I described, with the low pass filters.They were not functioning properly except on 40 meters.They advised me to send the unit back to them and said the turn around time at this time of year is between 4 and 6 weeks.Before I send it back,and it is no longer under warranty,I would like to know if anyone else has ever experienced this problem?Did they have to send the unit back to Yaesu?I only use my ft100 mobile with the atas antenna.I would appreciate any comments on this matter.73 Alan-K2ACB@...

Hey All,

I have been contemplating the same mod, this one is identical to the one in the archives here and on QRZ.

One I noticed in my rig is that the first resister is already gone, i.e. was never installed at the factory!

My rigs SN is a 9D series.

Thanks,

Joe

From: Ignacy Misztal
Topic: 5756 Message: 5756

I just got my FT-100 from repairs. It seems to work fine but the ALC bar is gone. Could it be a sign of a bad connection? The signal sounds better now than before the repairs.

On another note, can IF Shift and RIT work simultaneously? While in RIT, I can push the RIT button to activate the IF Shift, but when I push the RIT button (slow or fast), the RIT function activates but the IF Shift settings are gone.

Ignacy, NO9E

I'm sure you've checked this, but I had a similar "failure", also with an external key, and found it was because I had inadvertently left my rig in the SPLIT mode from an SSB contact when I switched to CW, with a different function key "window" visible. Of course when I'd key it would switch to the SSB channel and just sit there, while I listened for the "dits" instead of looking at the frequency dial. Operator error, which I'm sure will happen again. Hope yours is as simple a problem.

Yes I have. Be very careful with the tiny ribbon connectors if you decide to do it. It's well worth the effort. You'll be able to talk on the local police and fire frequencies, and if you know the codes you can call anywhere in the world on on your local cell sites!!!!

5760. Sounds muffled on AM/10meter

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-15 15:09:50 UTC
From: jsmail@mac.com
Topic: 5760 Message: 5760

Have only had my ft100 for a week now and so far I'm pleased. But when I transmit on 10meters in AM mode the audio is almost useless. Reports I get are I sound like I have a pillow over the mic. SSB and FM the quality is awesome!

I had to do the HI SWR mods and they worked! On my unit the antenna sheild to chaisis is what fixed that icon. I have the the radio grounded via 1 inch braid from mounting bracket to auto frame. I also have RF chokes on the mic, and external speaker extentions. (running extention kit)

I changed the AM carrier to 225. Mic gain at 50 and PO is at 25. Tried all the DSP mic eq settings and still muffled audio.

Anyone have any suggestions?

Thanks-

John

Greg-

Why would you want to TX on local police and fire freq.? I suppose if
your "on the job" it would be convienant.

And as far as the cell sites I thought the highest TX was only 470Mhz?
8-)

Bernie OM,

My measured power output on frequencies higher than about 460 was low to nothing. It dropped off very sharply, not like the VX-5R which hung onto full specs tx and rx right thru GMRS and FRS.

Another FT-100 we setup for 6M AM needed the AM carrier set to about 210.
Vary that around while listening on another RX.
PO of 33-35 seems to be the best spot for that.

I own a Yaesu 2400H 2 meter rig. I bought it new back in '93. One day I was loading some lumber into the car and one of the boards slid forward and smashed into the radio and bent the tuning knob clean off. It was bent inside so I couldn't just put it back on.

I put the radio into storage for the time being, after changing cars, and last year got it out to see if I couldn't fix it.

I ended up breaking it even more, so I broke down and sent it in to Yaesu for repair.

Yaesu replaced the rotary switch and two small pots. It seems they also modified the radio to transmit out of band. (I didn't ask for that but I'm not complaining too much.)

Total price: $60 plus shipping. (I paid to ship it to them. I didn't have to pay to ship it back.)

I just say that ICOM has droped the price of the 706GMKIII.
Look like $925.00 is the cheapest I have seen it.
Maybe this will push YEASU to drop the FT100D below $1k.

Cheapest I have seen the FT100D for is $1099.
Still, that is alot of extra $ for the yaesu.
Would be a great Christmas if Yaesu would match the ICOM price!!!

5776. FT-100 for sale or trade for 706MKII

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-15 23:17:38 UTC
From: cqdx@sonoratx.net
Topic: 5776 Message: 5776

8 month old FT-100 in perfect shape, BUT it has made a trip to Calif. for the RFI problem that toroids on the power supply line didn't totally cure.
Works fine now after the factory fix. I'll include Yaesu shop order and letter from them, of course. Includes all acc.
I'd like to get $ 800.00 but I'd rather trade for a clean ICOM 706MKII or G model....I'd be perfectly happy with a MKII.

I'm really more comfortable going mobile with a 706 than with the FT-100.
Thanks,
John

Chuck,
I was wondering What info from this Group might have caused this "no confidence" thing you have. Maybe you read the whining and crying of a select 2 people in the group who post tons and tons of ranting and ravings about how bad thier rigs were. One of these 2 people has not had an FT 100 for quite some time and the other just got his rig back from service in the UK and seems to be happy with his this week. I would say that 90% of owners are happy with thier rigs and have let it be know that they are.
Mine had the fan problem on U/VHF and the 10 mtr SWR icon witch was not that big of a deal as a fixed station. Came back from Yaesu Service in all of the packaging I sent it in and I could not be happier with the rig. Keep in mind I was happy with it before I sent it in for service now I'm happier then I ever was before.
I know that someone elses good reports are not likely to change your opinion of the rig and it is my guess the when you get back you will end up selling the rig because you will not give it a chance and that's a shame. I and the rest of the happy owners wish you the best of luck with your rig and hope you give it a chance to change your mind.
73 and Happy Holidays de KG4FET Sandor PROUD OWNER of the Yaesu FT 100 set up stock out of the box. Keep Those Processors OFF!!!!!!!!!!

Am I to assume that of the "select 2" I am one ?? I do not recall posting tons and tons of ranting and raving.
I have made several comments about the fact that I bought a piece of equipment for ?800 (around $1000) that did not work correctly and justifiably expressed my views, as have many others, as to this fact.
I was under the impression that this was one of the purposes of this reflector, i.e. to bring to the attention of others the good and bad points of the FT100.
It has some very good points and some very bad ones too. Even Yaesu UK have said as much, but when you finish up with a box with add on bits, self adhesive copper tape everywhere and grounding straps fitted by the MANUFACTURER (or his appointed agent) just in order to make the thing work according to a basic specification, then I feel that something should be said on the matter.
It is then down to the individual to make their decision as to exactly how they wish to spend their money and what they will get for it !

However, my FT100 is now working well or rather, as it should. But within its innocent exterior lurk rather more adaptations that I feel should not need to be there !

There is one point not to be overlooked and that is the fact that if the FT100 (and the D) was perfect in every sense, this reflector would be very quiet, just like the one for the FT847 !

May you all have a Very Happy Christmas.

You do know that it's a crime to transmit on these frequencies.

Just a reminder:
It's illegal to use this radio on any frequency you aren't licensed
for. It's illegal to use it on most frequencies outside the ham
bands (including CB) because the F.C.C. requires equipment used
in most other services to be 'type accepted'.

so far mine is working 100% aok (touching wood, also) - i get reports of clear audio, no muffling, or audio probs - OK, i admit i'm a little worried that the fans don't cycle when its idle - but if you notice when you flick to a memory channel that is empty - suddenly the fans come on - strange bug, methinks...

but apart from that i've had no problems, OK, i'm only a novice, and so am not running on HF, and running at minimal power on VHF & UHF

either way - i still enjoy reading the list, good to hear that people are overall, happy with this rig!

I have been thinking about buying a mic for my FT-100. 99.9% of its use is base.

Do any of you guys have the Hiel Gold Pro? Are you happy with it? Do you think it sounds better then the stock mic?

Most of my use is 2M simplex FM, but I do spend a good bit of time on SSB (and AM if I can get it to work). I was thinking about the Gold because it has 2 different elements, 1 for AM/FM and one for SSB. You can pick between the HC-4 and HC-5 element and I assume I should get the HC-5?

It looks like I have to by the Mic, a cable, and an adapter? Has anybody just bought the mic and built the cable and adapter?

Ok, I have seen the picture (although its in German I think)
http://www.qsl.net/dl0kp/antennen/ft_100.gif

Now If I am just hooking up a mic and PTT switch, they show the
mic audio going to pin 8 and the mic shield going to pins 7 and 5,
do I need to wire to both pins 7 and 5?

Also they show the PPT going through R1 and R2 to pin 6, but
what does the other side of the PPT connect to so it will complete
the circuit when closed? I would assume the mic shield?

Thanks again for the help

5792. Motorized Antenna Mount for ATAS-100?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-18 17:42:17 UTC
From: Brian Short
Topic: 5792 Message: 5792

I am trying to find a motorized mount for my ATAS-100.

I am installing it on a 1998 Lincoln Navigator.

Diamond says their K9000LTR would not handle the ATAS, and Comet says the same thing about their MK30-H.

Has anyone located a motorized mount that is substantial enough to handle this antenna?

Anyone else on the list with a Navigator or Expedition have any luck mounting this dog? (Keep in mind, I park in a parking garage with a 7' clearance on a daily basis)

Thanks for any input & 73.

Carlos,

My memory of the exact part number is bad, but if the CK-3M is the cable with the 1.5 foot step down coax (i.e. goes from larger coax size down to a small size for the last bit), I had bad luck with that particular cable. It may be unique to my installation, but the ATAS-100 wouldn't tune until I replaced that step down cable with a continuous piece of RG-8M (or RG-8X, RG-58 type coax). I think the ground shielding transition was bad at the step down point.

Also, in my opinion, if you have to adjust the length of the coax to get the SWR correct, you've got an SWR or grounding issue at the antenna that needs addressing.

Good luck,
Bob K5WA

Hi All:

On a slightly different subject, I am trying to decide between K550
and K540 rack mounts for my Subaru, and whatever associated hardware I need.

As I understand it, the non-coax included mounts, don't have any SO-239
or NMO hardware, just a hole, you provide the hardware.

I don't like Diamond's overpriced/short RG-316 cable solution. I'd much rather
use a SO-239 barrel connector, so that I can connect directly with my
existing RG-316 cables on the bottom and a Comet SB-15 on the top.

Larsen's base station adapter for their mobile whips uses this scheme, but
I have no clue if the hole diameter is already too big.

Have any of you managed to mount SO-239 barel connectors in one of these
Diamond mounts?

On a slightly different subject. My installation requires a HF-6M / 2M-440
duplexer. All I have been able to find are the Diamond MX-62M, and Comet CF-706A, both with
coax. I'd much prefer a duplexer without coax (with SO-239
connectors directly on the duplexer case), but haven't been able
to find any.

Any negative/positive comments about the Diamond vs. Comet duplexers?

Lastly... What's the cheapest place to buy FT-100 options, especialy the
ATAS-100? Texas Towers seems to be pretty good, but maybe there is better?

Thanks/73

>you've got an SWR or grounding issue at the
antenna that needs addressing.
<

On a similar theme, the ATAS will be tuned at one frequency, but if I go 10 kc up or down, and come back to the same freq, it won't be tuned. Or, if I tune and then turn the radio and jeep on, when I turn them back on, the radio isn't tuned.
-Does this sound like a SWR prob?
-Also, a nice feature is the visual CW display on the dashboard button for the rear window defroster, eg, it lights up in synch with the CW, but not on SSB.
-Still learning

I used to have a 1995 Mercury Sable with a similar "feature" - the tachometer performed flawlessly as a modulation meter on 40m SSB.

I recently sent a query about heavier duty motorized
antenna mounts (up for operating, down for parking
garage--Top of a full size SUV)
I will be mounting 2 antennas on the shaft (2m/440
dualband and ATAS-100 Yaesu HF)

Since no one seems to have done this before, I guess I
am off to the workshop to give it a shot.

Here is my proposed design

1 Gearhead motor. minimum torque requirements: 41
kg-cm
(Having lots of trouble finding one to meet that
spec!)
1 1/4 inch shaft
1 1/4 inch flange bearing mount
2 1/8th inch 6"X2" steel pieces (antenna mounts)
2 Micro switches (for end of travel stop)
1 finger piece (for activating micro switches)
A control circuit of some type to allow a one touch up
and one touch down operation...still working on the
simplest way to do that!

Any input....(Especially where to find a motor like
that?)

Thanks &73

I have seen three motorized antenna tilt arrangements here in Utah, two are based on windshield wiper motors and one uses commercial motorized marine mounts. One of the wiper motor jobs raises a full size metal whip (102") that is connected to a fixed mount HF screwdriver antenna, acting as an remotely controlled antenna tuner. The other setup uses two wiper motors to raise a multitude of antennas mounted in two rows on the ultimate SUV, a civilian HUMVEE. The wiper motor arms drive 2 pushrods that run the length of the hard top of the HUMVEE, and every two feet or so the pushrods connect to a pivot arm with an attached antenna, there are either 6 or 8 small whip antennas for a variety of Ham, Public Safety and aviation radios involved. The commercial marine setups are on a National Guard command/communications trailer (not milspec, but built for state/civil events), there are four mounts with control boxes mounted at the radio console, for VHF/UHF antennas.

Maldol makes a mount like you are describing, but I think the ATAS 100 is too heavy. However, you should check it out.

I think the ideal solution would be a loop antenna, but none of the vendors makes one that has as wide of a range as the ATAS100. The advantage to a tuned loop is that the variable capacitor is a pretty reliable adjustable element. The loop could lay just a bit above the roof and should be "garagable".

Looking at the design equations for a tuned loop, I think the narrow range of these loops has something to do with the Q getting very high at low frequencies.

Topic: 5807 Message: 5807

A CHRISTMAS POEM

'Twas the night before Christmas and all through the shack
The rig was turned off and the mike cord lay slack.
The antenna rotor had made its last turn,
The tubes in the linear have long ceased to burn.
I sat there relaxing and took off my specs,
Preparing to daydream of armchair DX,
When suddenly outside I heard such a sound,
I dashed out the door to see what was around.
The moon shone down brightly and lighted the night-
For sure, propagation for the low bands was right.
I peered towards the roof where I heard all the racket,
And there was some guy in a red, fur-trimmed jacket.
I stood there perplexed in a manner quite giddy.
Just who was this stranger - di di dah dah di di?
He looked very much like an FCC guy,
Who'd come to check up on some bad TVI.
I shouted to him, "OM, QRZ"
"Hey, you by the chimney, all dressed up in red."
I suddenly knew when I heard sleighbells jingle.
The guy on the rooftop was jolly Kris Kringle.
He had a big sack full of amateur gear,
Which made a big load for a prancing reindeer.
Transmitters, receivers, for cabinets and racks,
Some meters and scopes and a lot of co-ax.
He said not a word 'cause he'd finished his work
He picked up his sack, then he turned with a jerk.
As he leaped to his sleigh, he shouted with glee,
And I knew in a moment he'd be QRT.
But I heard him transmit as he flew o'er the trees
"Happy Christmas to all, and to all seventy-three's."

5808. Re: ATAS-100 MOUNTS

Bob,

While the problem causes SWR trouble, I would guess the problem is actually a mechanical issue with the antenna if it is changing after simply moving frequency. Since I don't have many facts to go on here, the one clue that caught my eye was the word "jeep". I associate "Jeep" with a stiff ride over off-road terrain. You may have one of the fancy smooth riding ones and only drive on paved roads, but I would try a simple experiment by leaving the rig on while the jeep is off (thereby, no vibration from the road or engine), tune to a frequency, move up/down 10 kHz, then back to freq 1. If it still jumps SWR under those conditions, that should eliminate mechanical vibration to the ATAS-100 as a possibility. I hope it is mechanical vibration in the antenna because then you only have one issue track down. If it isn't, you now have to suspect your rig, coax and antenna mount.

As far as the blinking light (I'm glad to know you're a mobile CW op!), you might try putting a ferrite torroid (don't bother with those clamp-ons from Radio Shack, they don't have enough coupling) on your coax at the antenna mount (out side the vehicle). The "right" torroid is something I have to research every time I do this, but it must have the proper RF blocking characteristics over your operating frequency range to isolate RF on the antenna from traveling back inside to the car/jeep. Even though you're basically sitting right next to your antenna, it might drop the level of RF getting into the car. You'll have to read the charts/graphs that come with each torroid to see if it is proper for your installation. Even if it doesn't "fix" the light issue, it is still good practice on any ground plane dependant vertical and may help in areas you don't even realize right now.

Good luck with the detective work!

Bob, K5WA/m

Hi Brian,

I can't help with the design details directly but I fel that the
following offering might help. I do the same for my installations
since a mag-mount came off the car at 70mph and went through the rear
window - which was a frameless tail-gate... :-(

Murphy says "What can go wrong - will go wrong"

OK?
What happens in your proposed design IF the miroswitch fails at either
end of the travel?

Is the up/down switching electro-mechanincal or electronic? If electronic then expect that it will operate unexpectedly!

What are the consequences if the antenna "decides" to go up/down at the wrong time?

Etc. :-)

I would look at using a mechanical system that did not rely on electrical switching - something like a part threaded bar - so that the motor could run continuously in either direction and the antenna stopped at the top/bottom of travel.

It is probably better (safer?) to use "hard" switching for forward/stop/reverse the motor.

Over-engineering is probably a good thing. I use the "two failures before catastrophy" rule - I would hate to ask the insurance company to pick up the tab for my antenna going through the windshield of the car behind at 70mph!

In the UK if a commercial mount fails and causes harm, then the manufacturer or importer can be held liable. If I make the mount myself and harm is caused - I am in deep do-do.

I hope that this helps.
All the best for Christmas and the New Year to all..

Hi,

You might want to try a marine equipment dealer. I believe I have seen motorized mounts for marine antennas in catalogs. Some marine antennas even for smaller ocean going boats are rather large (12-18 feet of fiberglass and up to a couple inches in diameter at the base).

Just an idea.

Two questions.

I have a Land Rover Disco. Since the vehicle is overheight I had thought about mounting the ATAS on the front "Bush Bar"(since there are some handy holes) Any thoughts? I would run a separate ground wire to the frame.

How about mounting the FT100? For the life of me I cannot find any place to mount the remote head using the Yaesu remote head mount. Has anyone installed a FT100 in a Disco? Curious how you did it.

If you haven't seen the Maldol motorized mount, it tilts the antenna rather than going up and down. It didn't occur to me that you wanted to do just vertical motion. If that is the case, one idea would be to get these pistons that run on compressed air. I don't know the correct name for these items, but I see them in surplus shops all the time and have some friends who build stuff out of them. Case in point, for Halloween, they use these cylinders to have a corpse jump out of a coffin. Yes this is for real. I have bought these air cylinders for these guys for virtually nothing (like $2 each). To get more vertical travel, you could put them in series. The advantage to the air cylinder is no stops are needed. The fully extend and retract based on air pressure. The disadvantage is you need solenoids to turn on the air flow (which are also found in surplus shops) and of course a supply of compressed air. Anyway, just an idea. The compressed air can be stored in a tank and regenerated from a small tire inflator.

5819. THE CURE FOR THE LOOSE KNOB!!!!!!

Yahoo group: FT100 (1998 — 2000)

From: kg4fet@aol.com
Topic: 5819 Message: 5819

I was cleaning my face plate today and thought that since this had been a issue for several people I would investgate the cure.Its pretty simple and not all that involved.
First remove the rubber from around the Main Dial. Look for the very small allen screw deeply recessed in the Main Dial. loosen this and remove the large knob. Tighten the spring you will find attached to the remaining shaft using the tab on the bottom by screwing it down on the threads. Reassemble exact opposite and you have it made.
It's not a problem with the VR as had been feared but nothing more then the retaing spring being loose. I wish you all a Happy Holidays and all the best de KG4FET Sandor PROUD OWNER OF YAESU'S FT 100!!!

PS: THE FT 100 IS A FANTASTIC PSK RIG. I HAVE BEEN HAVING A BLAST WITH MINE FROM 6 MTRS TO 80 MTRS. IF YOU HAVE ANY QUESTIONS REGARDING USING THE FT 100 OR SOFTWARE I AM USING FOR PSK 31 PLEASE FEEL FREE TO EMAIL ME OR POST TO THE GROUP. 73 AND HAPPY HOLIDAYS AGAIN DE KG4FET SANDOR

I have an Isuzu Trooper and I made a metal L bracket that fits into my ashtray(who smokes these days anyway?) that's pretty sturdy, and its removable if needed. I drilled 4 holes in it and screwed the face mounting bracket from the Yaesu. So it still tilts and swivels. I don't know the layout of the Land Rover but thought it might help.

The lowest swr I've been able to see on the FT-100 is one bar which
I think means an swr of about 1.5.

Has anyone been able to key up and see no bars?

Not recommended for midwest winter operation. Might want to consider this.
Dont know your location but winters salt, salt, ice, -40 windchills, and
more salt can be rough on atas.

>Braided Ground Strap<

This is probably another stupid question from a one year old ham = but didn't I read that ground wire should be smooth, as it carries the current better than braided wire. I mean, I did read it, but does it make any difference, either mobile or base station ground.
For example, for my portable generator I use #8 bare solid copper wire, as rec'd by the electrician.

From: Charles Scott
Topic: 5712 Message: 5827

Bob:
Depends on what type of ground you're talking about. If it's a DC ground or current return, then it doesn't make any real difference. If it's an RF ground, then there will be some difference between braided and solid, but often you can't run solid anyway when you need the ground line to be able to flex. If it's a ground strap at an antenna base where flexing is not a requirement, then flat copper strap is the best way to go. Also, for a ground used in a lightning protection system, again copper strap is the best alternative.
Practically speaking though, a larger braided line is generally going to be better than a smaller solid wire. For example, you'd be better off using the shield from a piece of RG8 for a ground than a single solid conductor, unless it was pretty big.
The main point for RF grounds is to keep it short for the frequency you're going to be operating on. This means two totally different things between HF and VHF/UHF. Also, try not to have real sharp bends as they add inductance.
Lastly, electricians have no knowledge of RF grounding and often what they want to do is in contrast to the best solution.
To add a funny story to this. My ex-brother-in-law once told me in a rather authoritative manner, just after having a CB antenna installed on his house (which made him an instant expert), that you really don't want to ground radios and antennas. His contention was that doing so would attract lightning and he wan't accepting my suggestion that he was wrong. Well...he was of a differnt mind after his antenna got hit and he had ball lightning rolling around in his kitchen. He was lucky he didn't loose the house.

Hi, all. I just joined the group and saw this post this morning. The following url has photos of a friend of mine who mounts a whopper antenna on an 18 wheeler. I hope there might be an idea there for anyone who is interested. If it will hold his antenna, it will hold an ATAS 100.

http://homepage2.rconnect.com/k0wlu59/choice2.htm

I'm enjoying the group and I especially appreciate the information about dealing with the SWR icon. It's been great help. Thanks and happy holidays.

Well Bob, for a one year old ham its certainly not a stupid question, and your grammar and presumably, keyboard skills; are quite amazing too! I'm just slightly
concerned about Mum and Dad letting you play with that portable generator ...

Seriously, hope Father Christmas brings you everything you want in a couple of days time !

==========
Bob OM,

The answers you received from the other lads are surely right on the money, but thought I might say it a different way. First, RF grounding has to consider the wavelength. On 2 meters, and more so on 70 cm, a couple of inches (5 cm) is significant. On HF one finds that the length of the ground wire from the base of , say, the ATAS-100 becomes the lower part of the antenna.If it is very long the matching may become a problem.

The inductance of a length of wire, and its inductance, is lower for wider widths. A flattened braid, or a thin copper strap is better than even #8 wire. The point your electrician friend was making has to do with impedance (mostly ohmic resistance) at 60 Hertz, and more importantly for a portable generator is the mechanical integrity of the ground wire. The ground wire should be of sufficient size to carry full ground fault current of the generator. The wire is recommended to be bare so that it can be seen to be intact, not having anything to do with its electrical performance.

For lightning protection, grounds of flat copper or aluminum are preferred (which material is used depends on whether the earth is acidic or alkaline). The sharp edges will cause corona, and help during a lightning discharge. It is also better mechanically than braid for outdoor usage. Again, lightning is a very high wavefront containing frequencies up through the high RF region, so a low inductance is always sought. For a more complete discussion, see the Polyphaser ads, and I believe they have a web page, as well.

One sugestion on installing the atlas 100 antenna. Stop at the radio shop and pick up a couple of spare nut for the atenna base. I have mine mounted in the box of my F-250. After a couple of months, tree branches etc. the antenna was loose. The nut that comes with it doesn't have enough treads to keep from stripping, a second one added as a jam nuts seems to have cured the problem. Save yourself the trouble of doing it over.

Hi Andy,

> Is there anywhere that describes how I can build my own version of the Yaesu
> CT-62 connector cable that includes a level converter?

If you look on the VX5 egroup there is a schematic for a level converter for that Yaesu HT. However, I asked a similar question of this list some months ago: "has anyone home-brewed their own version of the CT62?" and got no replies.

The CT62 may be better as a purchase. What's inside of the DB9 data hood is a circuit board with surface mount devices. There are a couple of transistors and a Maxim RS232 level shifter, some diodes and resistors. This seems to match fairly well with the published interface cable for the VX5R and VX1R, but not perfectly.

After a waiting period, I simply bought a CT62 instead of dinking around to build my own.

I had the same symptoms with my FT100 but 15 and 10 were also affected.
40 meters worked fine mobile. When I lost 2 meters, I had enough and
shipped it to Yaesu.
I received the radio in two weeks with a nice tech summary stating what they
did, and no charge
at the bottom of the bill. The mods they performed seemed to do the job,
but I never ran it mobile
again. I recently traded it off with full disclosure and told him of this
group. I'm hoping I don't see
a problem message from him. He seemed very satisfied with the radio. I'll
just wait for a more refined version to come out in the future.

I have 10 New MAXIM MAX252ACHL Dual RS-232 Transceiver Modules available.
These list
for $84.83 in small lots. I will sell the lot for $100, shipped CONUS.

73, Dick, W1KSZ

The unit price at digikey.com is $63.54 for the B rev. However, why you do
you need isolated 232?

Hi Richard

One of the other replys to my post was that they felt it wasn't worthwhile trying to brew up your own circuit, when the Ct-62 is so reasonably priced,... the problem is however I am in New Zealand, and bought the FT-100 while I was in Australia earlier in the year, as the local Yaesu agent was wanting about 30% more again for the radio. I contacted him asking about price an availability of the CT-62, and haven't had a reply, either it's his usual abysmal level of service, or his nose is out of joint because I didn't buy the FT-100 from him.

I guess I could try and buy one over the internet, but thought it might be just as easy to try and build. Good suggestion I might try the VX5 circuit and see if that works.

Cheers

Earla,
After a 3 week vacation in CA mine came back better then I could have
imagined. I would think that if you and the others who send in their
FT 100's are very specific as to what is wrong and observations as to
the preformance of their FT 100's there might be less trouble or
fewer return trips to Yaesu USA. The tech's at Yeasu cannot fix what
they don't know about. Good luck with it and I hope you get it backin
FB working order.

Henry,
I have played with an IC 706 and did not care for it at all. Menu functions are hard to access, fewer shortcuts then to often used funtions, lesser audio quality with the stock mic, buttons are small. I am a very happy owner of an FT 100 and would reccomend it to anyone. I have received nothing but excellent Audio reports on the FT 100. I will say that the NB does work FB on the FT 100 in mobile situations although I have not run a 706 mobile to tell you one way or another on it. Menu funtions are easy to access and are fairly self explaintory. Big bonus is the 300 memories. DSP is great and works very well. I will say that one thing I wish I did have was direct frequency entry via the keypad. All in all I love my rig and wouldn't trade it for the world. If you have any specific Question regarding the FT 100 please feel free to ask me.

5851. FT100D and WFM reception

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-28 16:27:49 UTC
From: mark@microenh.com
Topic: 5851 Message: 5851

Is this group appropriate for questions about the FT100D as well as the original? If not, is there a more appropriate group? If so...

I just got an FT100D as a Christmas present. It seems to work fine on HF and 2m / 440 FM. However, reception of broadcast FM and TV audio seems poor to non-existant.

I hooked the VHF/UHF antenna up to my 2m /440 beam antenna mounted at 60 feet on my tower. I was able to pick up a few of the local FM broadcasters, but not all. I could pick up 89.7 but not 90.5. Both come in FB with portable radios with built-in antennas. On 90.5, I was getting a full scale S-Meter indication but no audio. Is this a case of overload? With a more modest antenna (a whip on my operating desk in the basement), I was able to get 90.5.

With the outside antenna, I could not copy a single local TV audio carrier at the correct frequencies, however I did copy images of FM broadcast signals near the TV frequencies. For comparision, my Icom R7000 has no problem with the FM broadcast or TV audio (of course that radio is a VHF / UHF only receive only radio that cost almost as much as the 100D <g>).

According the FT100D manual, specs are only guaranteed in the ham bands, so is my FM reception typical or is it indicative of a problem with my new toy? I was hoping to be able to use the FT100D to listen to at least TV audio while mobile.

73,
Mark, N8ME

Mark,

Are you sure that you had the receiver on Wideband FM?

The symptoms are typical of trying to listen on Narrow band FM.

To access the WBFM hold the MODE key for a second to toggle between NBFM and WBFM etc.

As a test, I just listened to half a dozen local FM stations plus two VHF-L TV transmitters with the rig in the car with a 2 mx whip lying flat in the back of the Jeep, with the car under a metal carport!!

Cheers

5855. False SWR

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-28 21:45:22 UTC
From: william Panck
Topic: 5855 Message: 5855

Hello All,
My FT100 seems to have part of the hi swr problem. When on 10 mtrs
I get all the swr bars on the display when I key up on either upper
or lower ssb without speaking into the microphone, but when I speak
the bars disappear! I know the swr is low because I use the Mfj 259b
and my yaesu fc301 tuner to eliminate any swr the rig might see. Also
I have in line a Drake w4 swr wattmeter that reads no swr.Even more
interesting is that If I switch to FM or Am on the same Freq. The swr
bars never appear and again I have full output.
My question: Will transmitting with those conditions cause any harm
to the rig or is it just an inconvenience?
I have had the rig for about 2 months and so far like it veyr well
and have found no other problems.
I would appreciate any and all input.
Thanks Bill WD8QKO

Peter,

Yes, I'm sure I was on WFM. Also, I think the problem is related to overload. I switched my antenna switch to the ground position (antenna shorted to ground and not connected to radio - the only 'antenna' would be the coax running from the antenna switch to the radio, about 9 feet - in the basement) and I was able to receive more local FM broadcasters and the local VHF TV. I had no luck with UHF TV.

I also notice that even with this minimal antenna, every FM station that I receive gives a full scale S-meter reading. My S-Meter seems to work normally in the 2m and 440 bands.

And why NOT use the receiver for "wideband" reception? Jeeze ... the guy merely asked how to do it.

I am an over-the-road truck driver and use mine for that purpose. I only have satellite TV in the truck (no terrestrial antenna) and sometimes use the FT-100D for the "10 O'clock News" on the local TV channel/s. It also gets used for our National Public Radio (NPR), which is the ONLY consistent content radio programming available nationwide.

Having the CT62 is one thing. Is there software out there yet which will load up the memories, etc. on the FT100D? If that's out there, the whole game changes for me as I would like a way to load up the memories in an organized way...

5860. Fw: [FT100] FT100D and WFM reception

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-29 11:35:23 UTC
From: Andrew Walker (L)
Topic: 5852 Message: 5860

Sorry,

I did not wish to sound unhelpful, just a bit of seasonal jollity !

Must confess that I had never tried WFM reception and have now found that my local FM stations can be received with very good quality on the FT100. My lowest frequency local TV station sound is 485.25MHz and is also very good. But the transmitter for both FM and TV is only 15 miles away and line of sight.

All signals were full scale on the 'S' meter using a tri-band VHF/UHF vertical
antenna. We no longer have VHF TV in the UK but European video is often received S9
just below the 6 metre band during sporadic E conditions.

Hi Andy,

> Is there anywhere that describes how I can build my own version of
the Yaesu
> CT-62 connector cable that includes a level converter?

If you look on the VX5 egroup there is a schematic for a level
converter for that Yaesu HT. However, I asked a similar question
of this list some months ago: "has anyone home-brewed their own
version of the CT62?" and got no replies.

The CT62 may be better as a purchase. What's inside of the DB9
data hood is a circuit board with surface mount devices. There
are a couple of transistors and a Maxim RS232 level shifter, some
diodes and resistors. This seems to match fairly well with the
published interface cable for the VX5R and VX1R, but not perfectly.

After a waiting period, I simply bought a CT62 instead of dinking
around to build my own.

Having the CT62 is one thing. Is there software out there yet which will load up the memories, etc. on the FT100D? If that's out there, the whole game changes for me as I would like a way to load up the memories in an organized way...

5863. Mobile 17 & 12 Meter Operation with ATAS-100

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-29 15:15:02 UTC
From: sam@w4wq.com
Topic: 5863 Message: 5863

Hi and Happy New Year to the Group!

I am currently using an ICOM 706 MkII-G, an LDG AT-11 tuner and a newly released model Comet multiband antenna that covers (as sold without optional resonators) 40m, 15m, 10m, 6m, 2m and 70cm. There are optional resonators for 20m and 17m that can also be mounted at the same time as the other three. I am able to get satisfactory operation on 17m (without the optional resonator) with the tuner. So far, I have not had any success on 12m due to excessive SWR. Because I use the LDG tuner, I cannot operate on 6m without making physical changes to the hookup, which I don't really want to do.

This antenna is about 60 inches high, including the three HF resonators which mount horizontally (all three at the same time, and there are provisions for adding the other two, for a total of five resonators always available for use without having to get out of the car to change bands) at the top of the antenna. This arrangement also allows me to drive in and out of my garage without having to exit my vehicle (1999 Ford Escort Station Wagon)to lower or remove the antenna. The antenna is mounted on the lower left corner to the tailgate using a COMET RS-730 mount and an SO-239 connector/cable assembly. To prevent excessive flexing of the antenna and strain on the mount at highway speeds, I use a nylon cord that is looped around the antenna where the resonators attach and have it tied off to the roof luggage rack.I have the base of the mount grounded to the tailgate using a grounding strap, which seems to work quite well.

I am seriously considering getting the FT-100D to replace my Icom. I like the design and operation of the FT-100/ATAS-100 system, but am concerned that I will forfeit one of my favorite bands, 17m. On the other hand, I could keep my existing antenna system with the FT-100 and use their FC-20 tuner, which is good for HF through 6m, and use a seperate VHF/UHF for the 2m/70cm.

My reason for posting is to obtain the opinions of the eGroup members on the use of the FC-20 with my existing antenna or could the ATAS-100 provide satisfactory service on 17m?

Thanks for reading this long posting. I look forward to your opinions.

Mark,

My FT-100 works great on FM and TV, but only when I have a properly tuned antenna. Your 2M and 440 antenna are not harmonically related to FM and TV so they are acting like filters which try to block out FM and TV. I think that is why you saw a 9' piece of coax giving you a better signal than the antennas; the coax wasn't filtering out FM/TV frequencies. Even zero db gain is better than negative gain that a filter provides. But I think the first thing to check is your RF gain. I saw your comment that all the S-meter bars were lit. The RF gain/Squelch knob would be worth fiddling with, in my opinion. If you have that knob functioning as a Squelch control (I forget which function setting that is...I think it is in the 20s somewhere), then you have no control over RF gain, only squelch threashhold, which is the default, as I remember. I set mine on the RF Gain choice and I feel that I have much more control of the rig's sensitivity. But your preference really depends on where you operate most of the time. I'm on HF a lot and RF control makes sense. I have to put up with a little background hiss when I'm listening to Air Traffic or Police Band, but that's OK with me.

Play with it and I think you'll be happy when you see all the possibilities.

Jim,

I've had nothing but success with my trunk mounted ATAS-100 on all bands - including the WARC frequencies. I've had good luck breaking DX pileups with my FT-100 and ATAS-100 on all bands.

No mobile HF antenna will quite match the performance of a yagi atop an 80 foot tower, though ;-)

I too have the ATAS 100 and while the SWR is okay, the performance is much lower than most other antennas. I used an A/B switch with checks into Europe. The ATAS was about the same as a stick antenna and way below other longer antennas. By the way, the ATAS no longer functions at all. The insides corroded.

Bob,

Thanks for the tip on the antenna. I'm not sure that's the problem though. My Icom R7000 receiver works just fine on those frequencies with that antenna. Also I have a discone scanner antenna which is supposed to be good for all frequencies from 25 - 1300 MHz or so. I have the same problem with it.

I'll try the RF gain / Squelch setting.

I'm starting to think that the problem is that the front end is being overloaded.

73,
Mark

I am not sure which other 'longer' antennas Jim is comparing with the ATAS-100, but I have an idea. I have had no difficulty at all working Japan, Australia, Russia, or Europe with the ATAS-100. It also tunes up and works fine on 12 and 17 meters. For versatility and convenience, it would be hard to beat it.

It may be interesting to note that Jim Heath is the owner of High Sierra Antennas, a company that makes mobile motorized antennas. I would not expect him to be unbiased, but neglecting to identify himself properly makes his comments on the ATAS-100 seem like sniping.

Happy new year to all to all good DX.

Mine works great on all bands as it's advertised for. I break pile ups or am called first when starting out. You wont be disappointed with the 17m performance. I've worked all kinds of DX on that band.

Hi and Happy New Year to the Group!

I am currently using an ICOM 706 MkII-G, an LDG AT-11 tuner and a newly released model Comet multiband antenna that covers (as sold without optional resonators) 40m, 15m, 10m, 6m, 2m and 70cm. There are optional resonators for 20m and 17m that can also be mounted at the same time as the other three. I am able to get satisfactory operation on 17m (without the optional resonator) with the tuner. So far, I have not had any success on 12m due to excessive SWR. Because I use the LDG tuner, I cannot operate on 6m without making physical changes to the hookup, which I don't really want to do.

This antenna is about 60 inches high, including the three HF resonators which mount horizontally (all three at the same time, and there are provisions for adding the other two, for a total of five resonators always available for use without having to get out of the car to change bands) at the top of the antenna. This arrangement also allows me to drive in and out of my garage without having to exit my vehicle (1999 Ford Escort Station Wagon)to lower or remove the antenna. The antenna is mounted on the lower left corner to the tailgate using a COMET RS-730 mount and an SO-239 connector/cable assembly. To prevent excessive flexing of the antenna and strain on the mount at highway speeds, I use a nylon cord that is looped around the antenna where the resonators attach and have it tied off to the roof luggage rack.I have the base of the mount grounded to the tailgate using a grounding strap, which seems to work quite well.

I am seriously considering getting the FT-100D to replace my Icom. I like the design and operation of the FT-100/ATAS-100 system, but am concerned that I will forfeit one of my favorite bands, 17m. On the other hand, I could keep my existing antenna system with the FT-100 and use their FC-20 tuner, which is good for HF through 6m, and use a

seperate VHF/UHF for the 2m/70cm.

My reason for posting is to obtain the opinions of the eGroup members on the use of the FC-20 with my existing antenna or could the ATAS-100 provide satisfactory service on 17m?

Thanks for reading this long posting. I look forward to your opinions.

I absolutely love my FT-100/ATAS-100 combo! I had been using Hamsticks for years and had expected lesser results with the ATAS-100. That has NOT been the case. I have worked VK's, JA's, G's, 5H3, etc., with this combo. It works great, I get excellent reports and the convenience is super. As far as 17 Meters goes, this antenna is not "guaranteed" to work on that band, but mine works great there as well.

I recommend this antenna very highly. I am not associated with Yaesu in any way....I just love this mobile setup!

Happy New Year!

George

5880. CT-62

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-29 23:36:56 UTC
From: Andrew Davidson
Topic: 4422 Message: 5880

Hi John,
THanks for the offer, I will bear it in mind, however the VX-5R circuit seems quite straight forward, so will try that approach first.
If I strike trouble I will sing out.

I think Dan, KD0DAN 's comment about suitable software is also important. If you can't access the FT-100 to load memories etc, it is probably of little use for a rig that is predominantly used mobile?

Does anybody know if it is possible to load and save the Ft-100 frquencies, or is it simple not possible?

Cheers
Andy

Hi Richard

One of the other replys to my post was that they felt it wasn't worthwhile trying to brew up your own circuit, when the Ct-62 is so reasonably priced,... the problem is however I am in New Zealand, and bought the FT-100 while I was in Australia earlier in the year, as the local Yaesu agent was wanting about 30% more again for the radio. I contacted him asking about price an availability of the CT-62, and haven't had a reply, either it's his usual abysmal level of service, or his nose is out of joint because I didn't buy the FT-100 from him.

I guess I could try and buy one over the internet, but thought it might be just as easy to try and build. Good suggestion I might try the VX5 circuit and see if that works.

Cheers
Andy

I'm going to throw in my 2 cents about the FC20. I purchase one and it would not work with the FT-100, would not tune, etc. Made sure that menus and setup was correct, still nothing. I emailed Yaesu about 3 weeks ago about the problem and they said it was the SWR problem and needed to be modified. Well it had already been sent back to Yaesu and modifed. Still waiting for an answer. For now I would go with the LDG for mobil work. Here at home I use a MJF-941E and the FT-100 works fine.
Good Luck and Best of the New Year.

Dear All,

Just a thought about Jim Heath's advice on ATAS-100. Jim assisted me several months ago in getting my ATAS-100 to function properly. He mentioned that he had some connection to High Sierra Antennas and, when I asked him about it, he confirmed that he did make and sell them but made no effort to encourage me to consider them. I found his advice to be helpful and accurate and am grateful to him for the assistance he gave me in getting my ATAS-100 to work properly.

I was wondering if anyone has experienced HI SWR readings on SSB keying the mic with no modulation? My rig is brand new and this concern me. It comes and goes from time to time if I key the mic. It appears I have power output on the bar graph when this happens. Originally I thought this was the antenna but with my FT890 this is not the case. Has anyone had this occur and corrected by Yaesu?

John N8XSV

Hi John!

Almost any FT-100 has this fault.
I sent my FT-100 to Yaesu and it was fixed.
Never had this problem again.

After 2 weeks my FT-100 started falsing on 10m,my
friends Ft-100 did it out of the box . We sent them
back to Yaesu for repair . His was apparently fixed
the first time, mine had to make a second trip when it
started falsing on all bands. The radio is working now
and I really enjoy it. The falsing is caused by an
internal grounding problem.

5894. CT-62/CAT/memories

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-30 17:42:31 UTC
From: Lee Devlin
Topic: 5894 Message: 5894

I search around for the VX-5R level shifter circuit and found it at:

http://www.icongrp.com/~sllewd/pcware.htm

Please note that this circuit isn't just a level shifter, it's also a multiplexer for the DATA line on the VX5R (the same approach is also used on the FT50 and VX1R handhelds). That is, the radio uses the same line for both TX and RX since you never have to do them simultaneously. Like most handhelds, this is a 'cloning' function where you put the radio into a mode and then send or receive all the data at once. The FT100 has no cloning mode.

The VX5 circuit would not work for a CT62 replacement because CAT functions require 2-way communication with the radio. The CT62 is intended to connect to the BAND DATA cable pigtail. That pigtail has several other uses. It is the connection for the FT20 tuner and also the external amplifier data connection. Needless to say, if you're using it for a FT20 tuner or external amp, it won't be available for CAT functions.

What is CAT anyway? Mostly, CAT programs are integrated with logging programs so that when you log a contact, it can automatically read the data from the radio such as the frequency and mode and fill it into the appropriate fields in the logging program. CAT programs also allow you tune the radio and store 'memories' remotely on a PC to easily set the radio to another band/mode, much like an internal memory. This requires that you interact with a computer so it's not really a mobile kind of application.

The only way I could think of to automatically program the FT100 memories would be to figure out the protocol for the head connector and build and interface that would step through the memories and store them after loading the VFOs with the CAT interface. In other words, you would send a CAT command through the RS232 interface to send the frequency, mode, offset, tone, etc., and then another signal through the front panel interface to increment the memory and store it. It would have been so much easier if Yaesu included CAT commands that just emulated the front panel commands. If they're in there, they are not documented in the manual.

Another issue I have with uploading/downloading memories is that my FT100 is difficult to remove from the car due to the numerous connections. It would be easier for me to bring a portable computer out to the car to upload/download memories. With HT's, it's much easier to bring them to the computer so perhaps that accounts for the popularity of memory management programs with HTs.

I usually just store about 10-15 memories primarily because I find that there is a limit to how many stored frequencies are useful. These are mostly just local VHF/UHF frequencies with tones since I can't think of a

good reason to store many HF frequencies. If I get too many frequencies stored in a radio's memory, it gets hard to find the frequency I need quickly. I tend to feel that the 300 memory feature is just something to satisfy a 'more is better' kind of marketing need rather than be a truly useful feature for most hams. I'm sure there are others that need that many frequencies in memory or even more, especially for non-ham uses.

If anyone else has ideas about how to store and manage memories on the FT100, please feel free to jump in, particularly if you're using any kind of CAT program to do it.

Do you have the problem on all bands? Try transmitting into a dummy load. Most of these problem turns out to be bad grounding and lack of filtering. When I put my rig into my auto I was getting all kinds of RF feedback. It would not load the ATAS on 20 and when I keyed 10 meters my windshield wipers would turn on. I ran 6 inch wide copper tape from the ATAS mounting bracket to a bare section of chassis. (I removed the non conductive paint from the trunk wheel well. I also put ferrites on each cable going to the main rig. Cleaned everything up..

I searched the archives and can not find any posting from Jim with
helpful information about proper ATAS-100 installations, only
comments about how poor of an antenna it is, basically a stick, and
the least efficient of any antenna of that size. Not what I'd call
helpful, but that's just my opinion.

I'd love some useful comments on proper ATAS-100 installations, though.

Well, since I got this started, I want to jump back in to prevent it from getting nasty.

Jim never did say anything that was incorrect. My bringing attention to the fact that Jim was the owner of High Sierra Antennas was a result of noticing that he didn't identify himself with any kind of disclaimer while commenting on the ATAS-100. Normally, when someone makes a plug for a product, they will state that they 'are not affiliated in any way with manufacturer xxx, just a satisfied customer.' I feel that the reverse should also hold true. If you are a manufacturer and participate in a newsgroup that is set up for the purpose of discussing your competitor's products, then you also have an obligation to identify your affiliation when making comments about the products. This is especially true if you're making disparaging remarks.

I have no doubt that Jim has more knowledge of mobile antennas than anyone in our group and I would like to hear his opinions. I would expect his comments to be helpful and well supported with his own research. It sounds to me that Jim has done a lot of research on the ATAS-100 including how it might differ from a superior antenna such as one from High Sierra :-). Why not offer to compare them on their respective merits, such as relative efficiency, power handling, S-unit differences in receive and transmit, reliability, and construction methods? I'm sure that Jim's product would come out on top in those categories. There are other considerations such as ease-of-use and overall size that tend to favor the ATAS-100.

I think there is plenty of room for discussion of the possibilities for mobile antennas for the FT100. There's no need to prove that one kind of antenna is best or fits all customer needs. Some folks will like hamsticks, some might want a bug catcher, and others might want a High Sierra or an ATAS-100. There is no single mobile antenna that is universally good or bad and we shouldn't try to be settling that here.

From: Bob Conder
Topic: 555 Message: 5899

Message text written by INTERNET:FT100@egroups.com
>helpful information about proper ATAS-100 installations, only
comments about how poor of an antenna it is,<

I have been running the ATAS for a few months from my jeep.
Other than quirky SWR readings on 10M, I have no complaints abt the
antenna. The compromise installation is due to my jeep and the garage, not
the antenna. Eg, not grounded enough.
Using the Diamond K400 on the hatchback. Probably need to replace the
"coax" supplied with the mount, with some real coax, as noted on this list.
Also, you need to unscrew it when washing the car.
Have worked Ukraine, Poland, Chile, etc while commuting to work on a very
electrically noisy street.
For mobile CW, it seems to radiate back into the electrical grid for the
rear window defroster, so that the idiot light on the dash gives a visual
CW display, hi.
The tuning is so easy while you're driving 65mph (even though the manual
says not to do this).

5900. Re: [FT100] Hi SWR Indication

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-30 21:07:31 UTC
From: John Morgan
Topic: 5891 Message: 5900

Hi John. I experienced similar SWR (indicator) readouts but only on 12 and 10 meters. I use a Home Brew all band vertical antenna fed with open wire (at home) line so one might expect LOTS of "RF in the Shack" when switching to a non-matched ant condition until you get the antenna tuned properly. I found that disregarding the High SWR and going ahead and quickly tuning the antenna, using the SWR Bar Graph on the FT-100D resulted in proper operation once I got the antenna tuned for the 12 or 10 m frequency. Although this worked fine, it is, of course, an undesired anamoly. Installing a couple of clamp-on ferrites on the Co-Ax pigtail coming out of the rig solved the problem of the (temporary) high SWR, HOWEVER, it points out that the (internal) Co-Ax Shield grounding modification should definitely be installed on my rig. Having a bunch of ferrites hanging on the Co-Ax pigtail is unacceptable as far as I'm concerned. I will wait for a couple of months to see if other anamolies show up. If not, I will probably do the mod myself. If other problems arise, I will let Yaesu do the necessary mods. All in all, I'm very happy with the FT-100. With so many functions crammed into such a small package, I'm amazed it even works but it works beautifully and I'm making contacts I can't even hear with my older FT-757GX.

'Hope this helps --- Happy New Year; J. R. Morgan Jr. W6EIC

5901. ATAS100 as a compromise condo antenna

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-30 21:10:59 UTC
From: Mike Agner
Topic: 5901 Message: 5901

I guess the title says it all. I live in a condo with no trees around, so I can't string up something invisible (drat!!). I do have an attic, tho, and there's some room up there for a vertical.

I have heard that you can use the ATAS100 indoors, but how do you provide for the all-important ground plane for the antenna?

From: Dan Hayman
Topic: 5894 Message: 5902

Lee & group,

I do not know if this is off topic, but I remember somebody telling me about a quick project to build direct freq. entry pad for the ICOM 706 radios. I would love to see this article, because as far as I can see, there is no way to load the memories via CAT into the FT100, but a simple CAT circuit, built with a surplus keypad, etc. which could punch in a freq. would be VERY usefull--yer another wire to lead through the car--but possibly worth it. Any ideas?

From: Dan Hayman
Topic: 5891 Message: 5903

John,

For what its worth, I went that rout. The group helped me in determining the best way to do the SWR mod myself. It cleard things up. Should the radio go nuts in some other way, I will send it in as you sugested. The point--if EVEN I can do this mod, anybody can and it sure beats sending it in to Yaesu which will remove the OOB mod as part of their SOP.....

5904. Could we design a replacement faceplate?

Yahoo group: FT100 (1998 — 2000)
Date: 2000-12-31 01:59:44 UTC
From: Dan Hayman
Topic: 5904 Message: 5904

As all of you know who use the sep kit, the faceplate has a snap-on fitting. On the radio side, the wire must be screwd in. I am wondering why an after-market snap-on psuedo faceplate could not be designed which would allow more options for those of us who wish to use the radio in multiple locations. Those little screws will get lost at some point! I see a design where the interface wire screws into a plastic plate wich slides on the radio just like the radio's native faceplate...

A great after-market idea for somebody with the resources to do it. I also think it would sell more FT-100's as this is a documented week point.

As for me, the whole installation is used in the car in winter. In summer, the radio (not sep'd) and ATAS gets placed on the RV.

Thoughts or comments???

From: Lester Kemble
Topic: 5907 Message: 5907

I have my ATAS100 mounted on the bumper of a 1997 Mountaineer. The last week has been cold < freezing and when I am driving I get a picket fence effect when listening. I have noticed that this happens when the antenna is vibrating due to road conditions. I have checked the coax and the ground and made sure the antenna is tight. It appears that the problem is internal and related to cold weather. Has anyone else had this problem? Or knows of a cure for it short of a trip to Fla.

The Pro-92 group has a schematic for a similar cable. On
that Mail List, I learned I could use my ADMS cable for the
VX-5R / VX-1R with my RatShack Pro-92 and the GRE Demo
software.

It does indeed work. For those inclined, a comparison of
the circuitry may prove interesting.

I don't own this antenna and so am unfamil with the internals,
but is it is a screwdriver type with a spring loaded roller for
contact, correct?

I would suspect, element movement (at least on 2M/440 the
element whipping in the wind will do it), loose mechanical connection
in the mounting, bumper, or body ground. If the antenna is moving
relative to the body, or if the quality of the ground is changing due
to shifting of the out, or of the bumper it could do strange things.
The internals may be making intermittent contact due to vibration as
well.

You might take a look at the bumper to frame and mount to bumper
connections. If there is any shifting or corrosion ground quality
could be shifting. (I had to strap the bumper to the frame on my 80s
suburban, as the only ground is via the bolts, and this fails over
time (frame and bumper mount are coated, only metal to metal is the
bolts). Depending on vibration and water the grounding would vary
alot.)

Anyone have comments on the FT-100 in extreme environs? I was worrying a bit about freq stability on my FT-100 when dealing with -45F to +90F temp spreads (normal winter/summer spread here). Mainly worried about the cold, the radio gets left on in colder temps, but will still be operating in a 10F - 60F environment depending on what is happening at the time. (Cannot setup a base station so except for a 2M/440 HT I do all my operating out of the truck).

Just looking for comments/general info I guess. Haven't had trouble, but has mainly been used for 2M/440 FM this winter. Now that I have the halo and amp in I will be doing more 2M SSB, where drift can really matter.

Thanks, wl7cla

Les,

The noisy, intermittent operation you describe is, I believe, due to poor contact between the four B-B sized spring loaded balls that make the contact to the coil and the coil. If you raise/remove the rubber boot you will see them. BTW, I suspect you would also be astounded at the tiny size of the wire ... read LOSS ... and the small diameter of the coil. The antenna does an amazing job, considering all the reasons it shouldn't. (:-))

I am a retired career communications technician driving an 18-wheeler, as the four-wheelers call us. My first ATAS-100 failed on the second day, but the failure wasn't related to the coil/ball contacts. The mechanism simply seized up. BTW, there are two motors ... one for "UP" and one for "DOWN". The dealer (HRO/Denver) replaced the antenna with another one ... after grumbling and testing it to see that I wasn't trying to pull some sort of scam. I'll not be buying anything else there. (:-((

The second until operated OK, but exhibited the same performance as you describe. You might try listening to a weak signal and "wiggling" the antenna. I'll wager you'll hear the noise. I sold the antenna to a friend for fixed station use and he's happy with it. The antenna IS NOT up to the service on a semi ... in my opinion it's only suitable for a soft-riding sedan
on paved roads, etc, and might be OK on a golf cart (:-))

For another poster here on the reflector who asked about putting the AT-100 in an attic. There is a ground plane kit, but I think it's for VHF/UHF only ... not large enough. You might use "chicken wire", copper screen ($$), flashing copper strips or burglar alarm tape from Radio Scrap and lay out a cross for as far as you can reach or crawl in the attic.

I'm in the somewhat unique position of owning both an FT-100D and a IC-706MkIIG and have been thinking of writing a comparison for both reflectors.

The ATAS-100 is very short in terms of wavelength, and the loading coil
is small-diameter and the cross-sectional area of the coil wire is also
small. All these things mean that it has low Q, and is therefore not
very efficient when compared with a full-size dipole or even a W6AAQ
screwdriver antenna.

On the other hand, I have worked lots of DX on an ATAS-100. I was just
2 S-units down compared to my pals with their huge screwdriver antennas.

The level shifting circuit for the Radio Shack Pro-92 can be seen at:

http://www.egroups.com/files/pro92/Programming+Cable.gif

The one for the VX5/VX1/FT50 can be seen at:
http://www.icongrp.com/~sllewd/pcware.htm

Both circuits are functionally similar. That is, they multiplex a single data line on the HT and level shift it to match an RS232 interface on a computer.

Neither of these circuits will be suitable for CAT functions on the FT100 because you would need to switch modes when going from transmiting data to receiving data. That would require the use of something like a Maxim MAX232 chip that has discrete RX and TX lines.

From: Andrew Walker (L)
Topic: 5891 Message: 5918

"My question: Will transmitting with those conditions [hiSWR indication]
cause any harm
to the rig or is it just an inconvenience?
I have had the rig for about 2 months and so far like it veyr well
and have found no other problems.
I would appreciate any and all input.
Thanks Bill WD8QKO"

In the current round of discussion on the SWR indicator some members of this group have found that it can be disregarded and the rig will transmit normally on 10 and 12 metres with no high swr showing on external meters.

ISTR that some time ago that there was a suggestion that the FT100 can be unstable (i.e. self-oscillate) around 13MHz and thus produce RF output at that frequency. Would it not be unreasonable to suggest that the reflectometer circuitry finds this frequency unacceptable since it is outside the design spec. and thus throw up an erroneous SWR indication ? If so, it should not present any hazard to the rig but the level of 13MHz radiation from the antenna ought to be investigated !

Perhaps someone who has modified their rig for wide band transmit could confirm or otherwise that this is indeed the case. Into a dummy load, of course !

Had the same problem and fixed mine about 6 months ago. If you slide the rubber boot up you will see that the antenna relies on pressure contacts on ball bearings against the motorized coil windings. If not initially bent tight enough or due to vibration over time, the tabs can lose tension. To fix this problem permanently, slip 1" O rings over the base of the antenna (they'll stretch to fit), roll them up and install them over the pressure contact tabs. Then slide the boot back in place. Happy New Year, Tony N2SS

The external keypad entry project has been mentioned a few times on this email list. John Hansen, W2FS, was the author of the December 1999 QST article for the IC706. He has solicited this group for input earlier this year and was working on a version for the FT100. I can attest to the fact that John has many irons in the fire and frequently contributes to PIC applications for ham radio. I was under the impression that he was pretty close to having a product finished for the FT100.

I'll send him an email and get a status check on it.

It does seem a bit strange that this is the only connector that has external screws. And I agree those screws are small and easy to lose. I've almost lost them myself and wished that Yaesu had made the connector snap in like the head.

However, in my case here's what I have to do to get the rig out (I do have a separation kit):

Disconnect the VHF/UHF antenna connector
Disconnect the HF antenna connector
Disconnect the remote speaker connector
Disconnect the microphone cord from the main chassis
Disconnect the power connector
Disconnect the RF ground braid to the chassis (held on with a screw)
Disconnect the remote head connector (with its two little screws)
Carefully fish the radio out from down inside the console where it's hidden. (yes, all those connections are made and unmade in a very confined space)
Disconnect the microphone from the extension cord
Reattach microphone to chassis
Remove the head from its nest and reattach it to the chassis

If I had the chassis mounted in a bracket, there would be even more things to unscrew.

This is not going to be an easy task for someone entertaining thoughts of using the radio in the car during the day and in the shack at night. If you really need a quick install and uninstall, it would be best to leave everything together. Once you start down the road of using the separation kit, you're looking at a semi-permanent installation and making one of the connectors easier to disconnect will probably not have a dramatic impact on the overall inconvenience of moving the radio around to multiple locations.

Best just to stock up on those little screws :-).

Adrian,

Nevada were advertising the "New Model" FT100D in August RadCom with the ?CALL price tag !

Not seen it advertised since by anybody !

As to what to avoid..... there would not appear to be a specific band of serial numbers that are NOT prone to the usual "difficulties" as far as I am aware. Even the 'D' model has carried on the tradition !! Coming to terms with mine now though, bought in April with a 9J101*** serial number only 36 removed from one bought Stateside by a US amateur this year (2000).

Hope that helps.

Andrew. g3out

Has anyone noticed a freq. shift on FM When the voltage drops below 12.6? I operate with solar and battery power. It hasn't been sunny

enough to keep the voltage above 12.6 on the battery bank.

Mine went back and as far as I know others have not had the OOB taken out when they went in for service. If it's under warranty then send it in for all mods and chip updates. It's worth it in the long run.

John,

For what its worth, I went that rout. The group helped me in determining the best way to do the SWR mod myself. It cleard things up. Should the radio go nuts in some other way, I will send it in as you sugested. The point--if EVEN I can do this mod, anybody can and it sure beats sending it in to Yaesu which will remove the OOB mod as part of their SOP.....

Yaesu sells the ATBK-100, base mounting kit for the ATAS-100. I suspect
that a homebrew would be cheaper.

73,
Mark

DC motors are very easy to run in either direction by reversing the current through the motor. I cannot think of a reason Yaesu would include two motors. Rainer Arndt sent me some pictures today and I can only see one motor in the disassembled ATAS. The controller board has only a single pair of wires from which to run a motor. Take a look at

http://members.home.net/k0lee/ATAS1.jpg

to see for yourself.

Also, in the ATAS disassembly section of the FAQ, Cliff, N0HC, only mentions there being one motor in the antenna.

The atbk base mounting kit is intended to provide a ground plane on the vhf and uhf frequencies only. It is not intended to provide a ground plane for hf frequencies. Yeasu sugguests attaching it to a balcony handrailing for this.

Mine does fine. I often operate without the engine running and have never
had a problem.

Is the FT 100D really that picky about needing 13.8 V? Will it run
okay on the car battery when the car is not running? Thanks
